

## I2S AUDIO I/O CARD USER'S GUIDE

### 1. Introduction

The Unified Development Platform (UDP) provides a development and demonstration platform for Silicon Laboratories microcontrollers, short-range wireless devices, and software tools, including the Silicon Laboratories Integrated Development Environment (IDE).

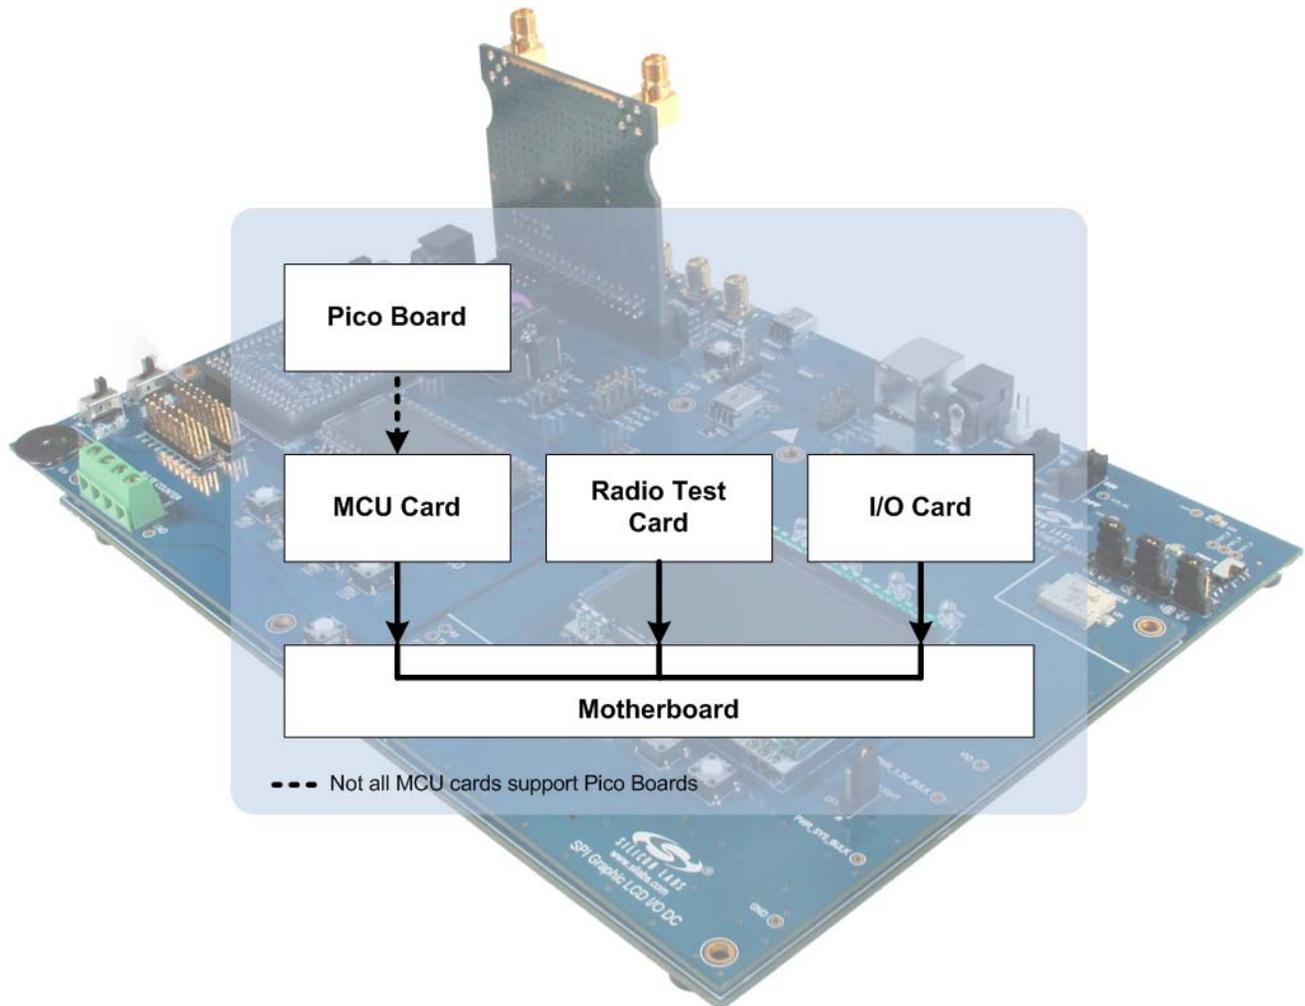

Figure 1. Unified Development Platform Block Diagram

# I2S Audio I/O Card

---

## 2. Relevant Documents

This document provides a hardware overview for the Unified Development Platform (UDP) system USB Audio I/O card. Additional information on the UDP system can be found in the documents listed in this section.

### 2.1. Motherboard User's Guide

The UDP Motherboard User's Guide contains information on the motherboard features and can be found at [www.silabs.com/udp](http://www.silabs.com/udp).

### 2.2. Card User's Guides

The UDP MCU, I/O, and radio test card User's Guides can be found at [www.silabs.com/udp](http://www.silabs.com/udp).

### 2.3. Examples

The Precision32™ Software Development Kit (SDK) includes example firmware using this board. More details on the use of the board can be found in the example documentation. The SDK can be downloaded from the website as part of the Precision32 package at [www.silabs.com/32bit-software](http://www.silabs.com/32bit-software).

## 3. Hardware Setup

Refer to Figure 2 for a diagram of the hardware configuration

1. Connect an MCU card to the UDP motherboard slot.
2. Connect the I/O card to the UDP motherboard slot.
3. (Optional) Connect a radio test card to the radio test card slot in the UDP motherboard.
4. (Optional) Connect an EZLink card to the EZLink card slot in the UDP motherboard.
5. Connect the USB Debug Adapter to the 2x5 debug connector on the MCU card with the 10-pin ribbon cable.
6. Connect one end of the USB cable to the USB connector on the USB Debug Adapter.
7. Connect the other end of the USB cable to a USB Port on the PC.
8. Connect the ac/dc power adapter to power jack J20 on the UDP motherboard. The board can also be powered from the J16 USB or J1 mini USB connectors.
9. Move the S3 power switch on the UDP motherboard to the ON position.

### Notes:

- Use the Reset button in the IDE to reset the target when connected using a USB Debug Adapter.
- Remove power from the target board and the USB Debug Adapter before connecting or disconnecting the ribbon cable from the target board. Connecting or disconnecting the cable when the devices have power can damage the device and/or the USB Debug Adapter.
- The MCU card can be used alone without the motherboard. However, the motherboard must be powered if an MCU card is connected.

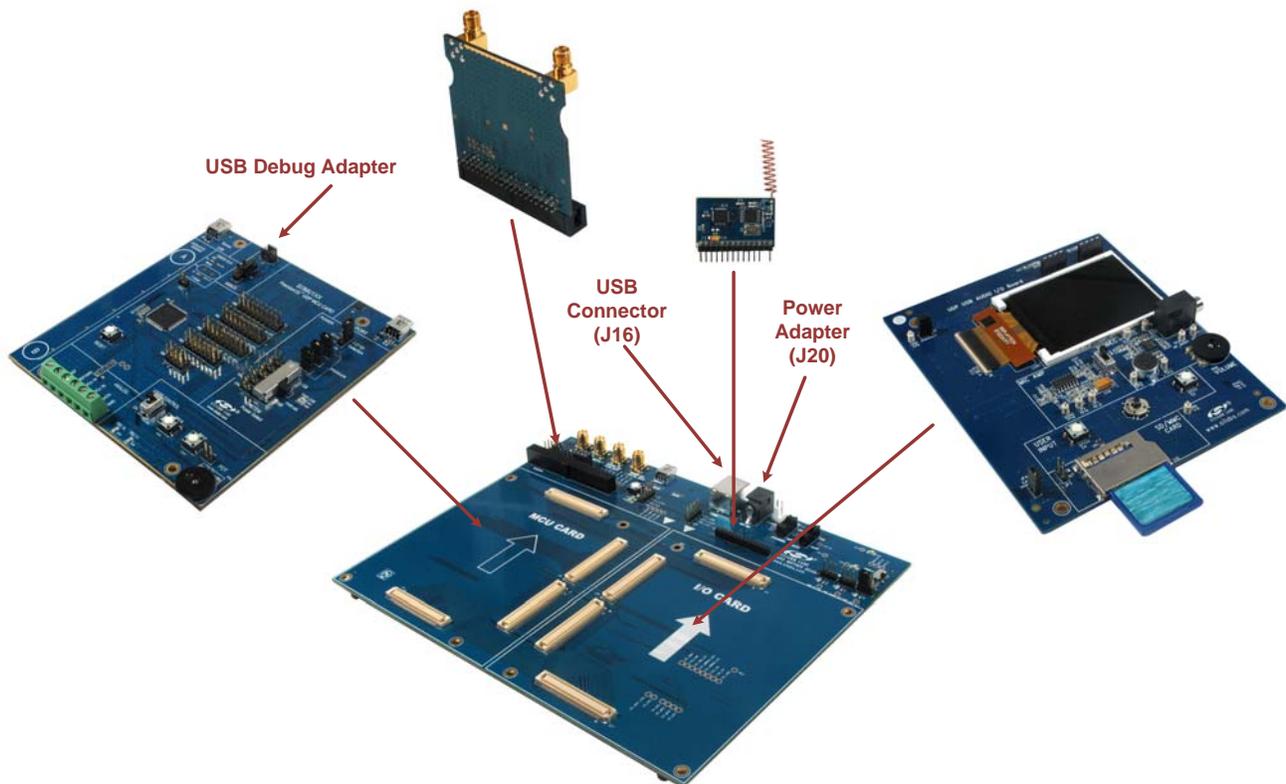

Figure 2. Hardware Setup using the Unified Development Platform

# I2S Audio I/O Card

## 4. UPIO-USB-AUDIO I/O Card Overview

The USB Audio I/O card adds a microphone, codec, and headphone jack for audio development and an SD card connector. The card connects to the I/O Card expansion slot on the UDP motherboard and provides complete access to the MCU resources. Each expansion board has a unique ID that can be read out of an EEPROM or MCU on the board, which enables software tools to recognize the connected hardware and automatically select the appropriate firmware image.

Figure 3 shows the USB Audio I/O card.

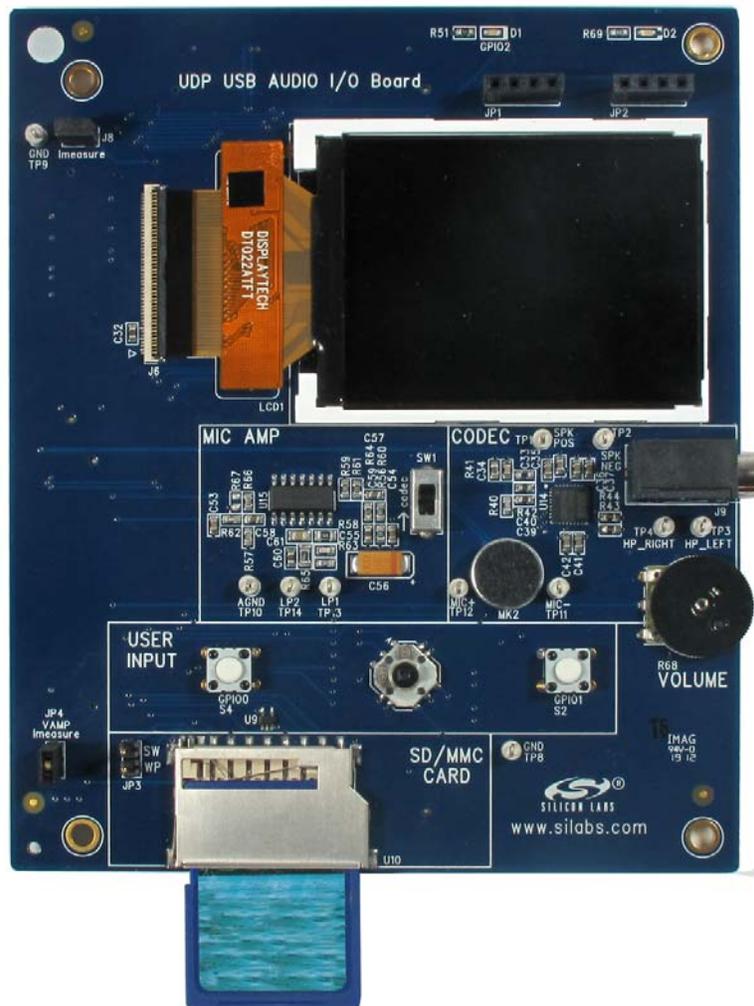

Figure 3. UPIO-USB-AUDIO I/O Card

Figure 4 and Figure 5 highlight some of the features of the USB Audio I/O card.

# I2S Audio I/O Card

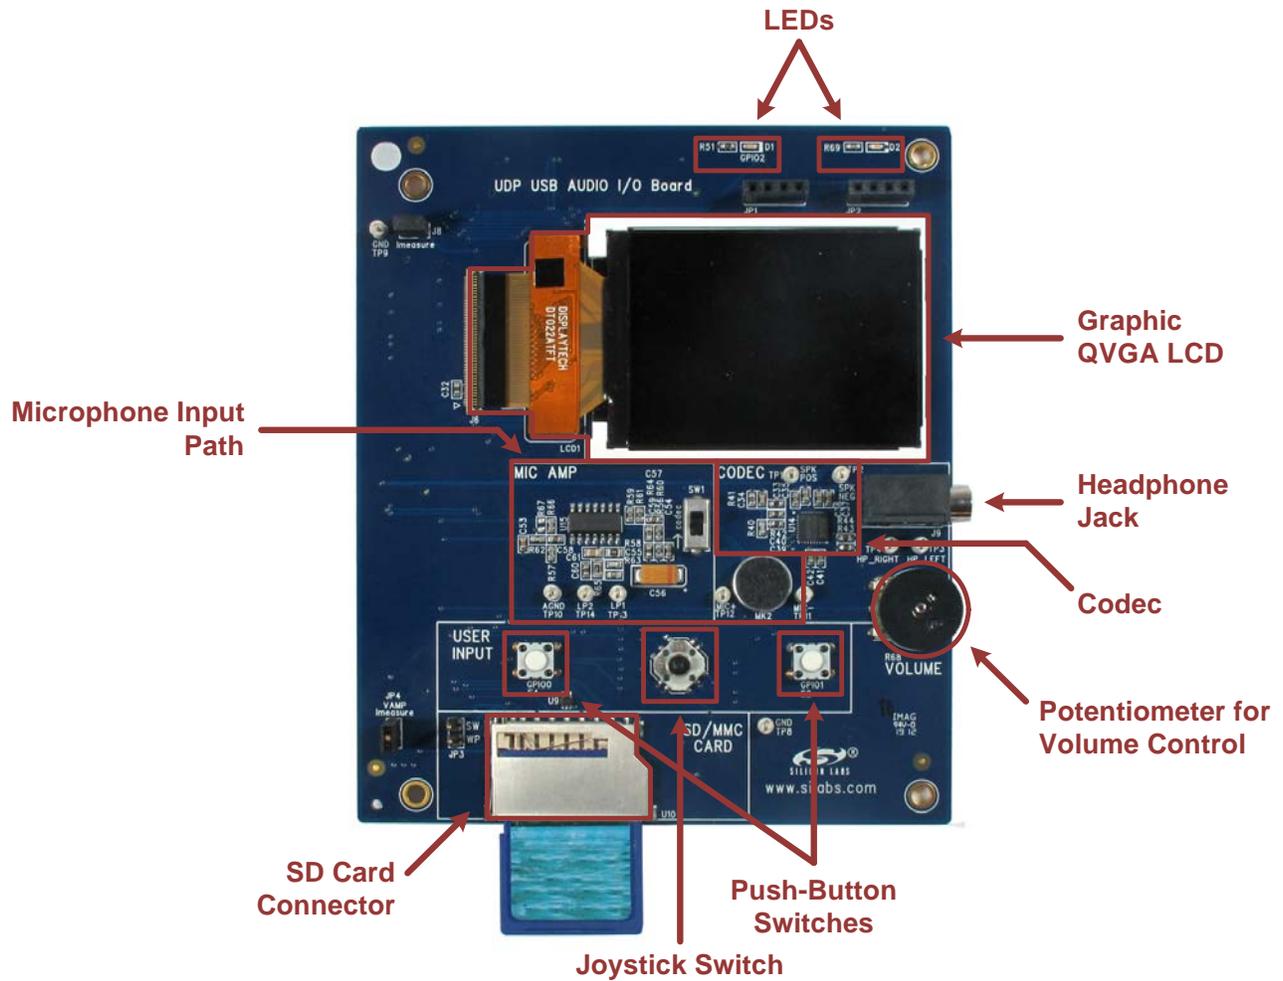

Figure 4. UPIO-USB-AUDIO I/O Card Features (Front)

# I2S Audio I/O Card

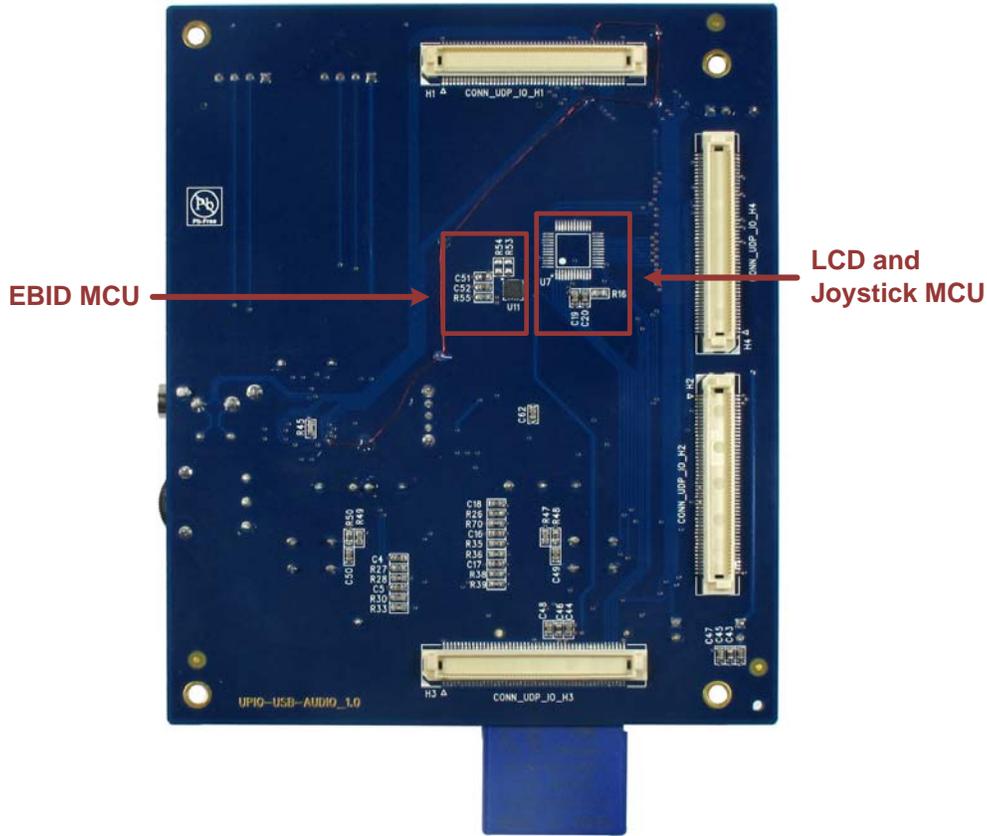

Figure 5. UPIO-USB-AUDIO I/O Card Features (Back)

## 4.1. Microphone Input

The microphone input system on the board consists of two input paths. When SW1 is in the upper position marked with →**codec**, the microphone connects to the codec (U14). When SW1 is in the lower position, the microphone connects to the ADC\_IN1 UDP signal through a filter and gain circuit. This filter and gain circuit is biased with the ADC\_VREF UDP signal.

## 4.2. Codec (U14) and Headphone Jack (J9)

This codec accepts register writes over I2C using the I2C\_SDA\_EZR and I2C\_SCL\_EZR signals. The TIMER\_EX\_A signal provides the clock, and I2SRX\_DOUT\_A and I2STX\_DOUT\_A are the digital audio data input and output signals. The I2S word sync (WS) and clock (SCK) signals can source from either the I2S receiver or I2S transmitter on the MCU card. The capacitors, resistors, microphone, and headphone jack connections surrounding the codec are based on the manufacturer’s recommendations. Table 1 summarizes the codec connections.

Table 1. Codec Connections

Codec Signal	UDP Signal
Command I2C data	I2C_SDA_EZR
Command I2C clock	I2C_SCL_EZR
External clock	TIMER_EX_A
I2S word sync (WS)	I2STX_DFS_A and I2SRX_DFS_A
I2S clock (SCK)	I2STX_CLK_A and I2SRX_CLK_A
I2S input (to codec) data (SD) (DACDAT pin)	I2SOUT_DOUT_A
I2S output (from codec) data (SD) (ADCDAT pin)	I2SIN_DOUT_A

## 4.3. Potentiometer (R68)

The potentiometer connects to the ADC\_IN0 signal and can be used for volume control. The MCU card must implement firmware to modulate the volume as the potentiometer value changes.

## 4.4. Switches and LEDs

The I/O card has two push-button switches (S2 and S4) and two LEDs (D1 and D2). The switches are normally open and pull the signal voltage to ground when pressed. Table 2 shows the UDP signal connections for these switches and LEDs.

**Table 2. Switch and LED Connections**

SW or LED	UDP Signal
Push-Button Switch (S4)	GPIO00
Push-Button Switch (S2)	GPIO01
Blue LED (D2)	PWR_3.3_BULK
Red LED (D1)	GPIO02

## 4.5. Co-processor MCU (U7)

The I/O card has a C8051F380 co-processor MCU (U7) that controls the Graphic QVGA LCD (LCD1) and reads the five-direction joystick switch (S1). This co-processor enables stand-alone demos that do not require a PC when connected with an MCU card through the UDP motherboard.

### 4.5.1. Graphic QVGA LCD (LCD1)

The graphic QVGA LCD (LCD1) connects to the co-processor C8051F380 MCU EMIF through the J6 connector. This color LCD (SDT022ATFT by Displaytech Ltd.) has a resolution of 320 x 240 resolution. The power consumption of the LCD can be measured using the J8 header. Table 3 show the co-processor port pin connections to the LCD.

**Table 3. Joystick Switch Connections**

LCD Signal	Co-processor Pin or UDP Signal
IM0	PWR_3.3_BULK

DB17	P4.7
RD	P1.6
RS/SCL	P3.0
WR	P1.7
LCD_RESET	P1.1

# I2S Audio I/O Card

---

## 4.5.2. Joystick Switch

The I/O card has a five-position joystick switch (S1) that connects to the co-processor C8051F380 MCU. The joystick is normally open and pulls a signal voltage to ground when the joystick is placed in one of the five positions. Table 4 show the co-processor port pin connections to the joystick.

**Table 4. Joystick Switch Connections**

Joystick Position	Co-processor Pin
Center	P0.6
Up	P0.2
Down	P0.3
Left	P0.4
Right	P0.5

## 4.6. SD Card Connector (U10)

The SD card connector (U10) connects to any standard SD card. The card power from PWR\_3.3\_BULK can be enabled or disabled by the SPI\_PWR signal connected to GPIO03.

The connector includes two mechanical switches: one detects if a card is inserted, and one indicates the write protection status of the card. The card detection switch connects to the GPIO04 signal. The JP3 header provides access to both the switch signals.

## 4.7. EBID MCU (U11)

The I/O card has a unique ID that can be read out from the Silicon Labs C8051F990 MCU (U11). This MCU enables software tools to recognize the connected hardware and automatically select the appropriate firmware image.

## 5. Using the I/O Card with the UDP Motherboard

### 5.1. Current Measurement

The power measurement circuitry on the UDP motherboard consists of a Silicon Labs C8051F351 8051 MCU that measures both input voltage and current consumption of the MCU card, I/O expander, and radio test card. When using the I/O card, install a shorting block on the UDP Motherboard J15 and J13 connecting the two left pins together.

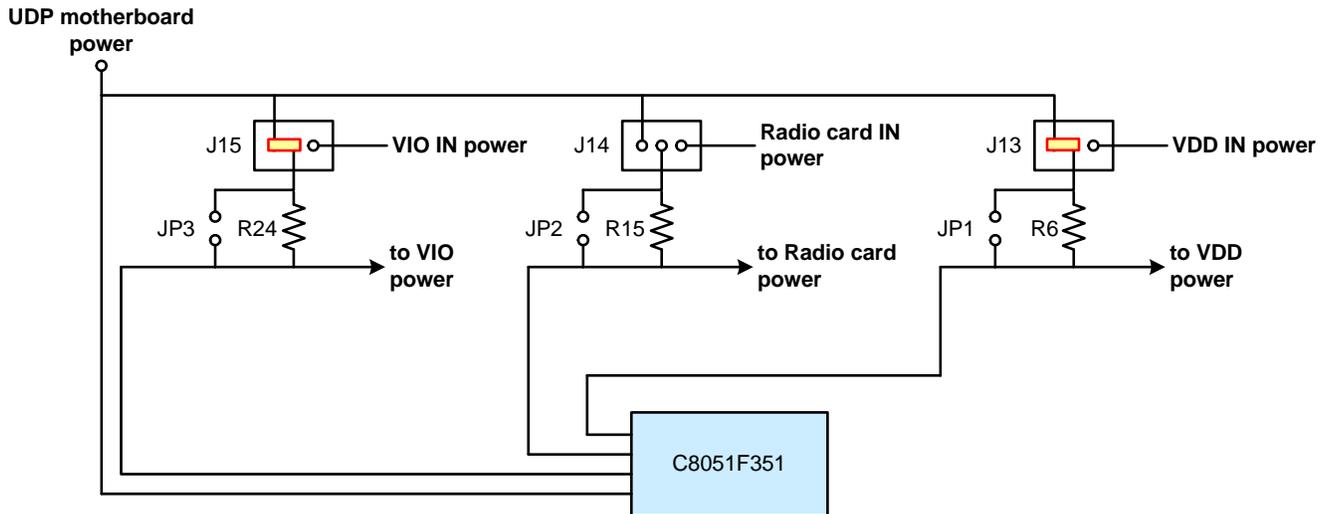

Figure 6. Power Measurement Diagram

### 5.2. I/O Card Header Connections

The I/O card has four connectors with 100 pins each. These 400 pins are directly tied to the UDP motherboard and MCU cards. These signals are named and designed to support a wide variety of features and applications, and the UPIO-USB-AUDIO card implements a subset of these connections.

The MCU cards and I/O cards are designed so that a maximum number of functions are shared between each card. This allows a particular type of I/O card to be shared amongst all MCU cards that connect to the same signals.

The I/O card slot includes the following components:

H1	I/O card connector H1
H2	I/O card connector H2
H3	I/O card connector H3
H4	I/O card connector H4

The UPIO-USB-AUDIO card implements the signals described in Table 6, Table 7, and Table 8, Table 9 in the Appendix.

# I2S Audio I/O Card

## 5.3. Shorting Blocks: Factory Defaults

The UPIO-USB-AUDIO I/O Card has a factory pre-installed shorting blocks on JP4, JP3, and J8. Figure 7 shows the position of the factory default shorting blocks.

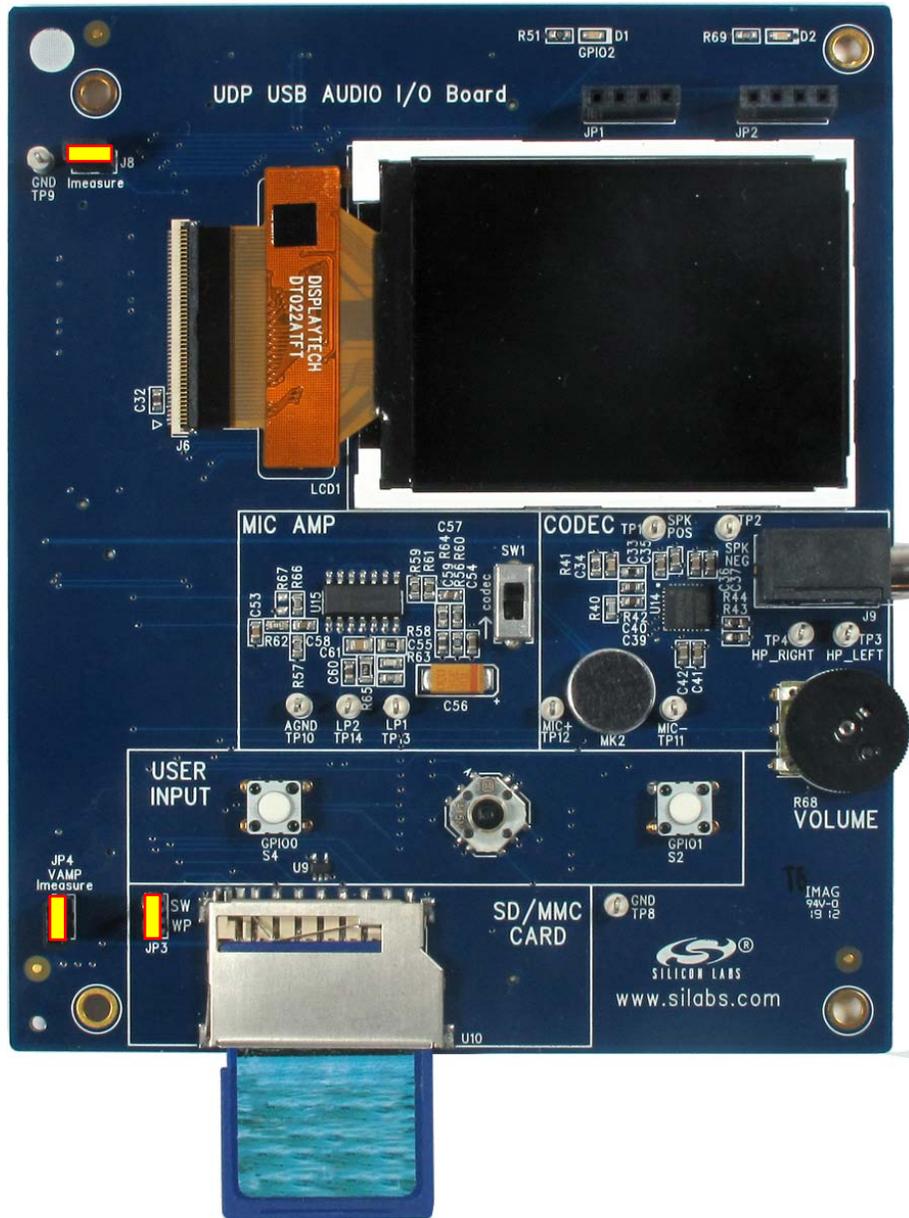

Figure 7. Shorting Blocks: Factory Defaults
