

AN1321: Configuring Peripherals for 32 Bit Devices with Zigbee EmberZNet 7.0 and Higher

Peripherals for Zigbee devices, running applications built with EmberZNet SDK 7.0 and higher, are configured using the Pin Tool in Simplicity Studio® 5. The Pin Tool simplifies peripheral configuration by presenting peripherals and peripheral properties in a graphical user interface. For some SDKs, many peripherals can also be configured in the Simplicity IDE as component options.

If you are developing with the EmberZNet SDK 6.10.x and lower, see AN1115: Configuring Peripherals for 32-Bit Devices using Hardware Configurator.

KEY POINTS

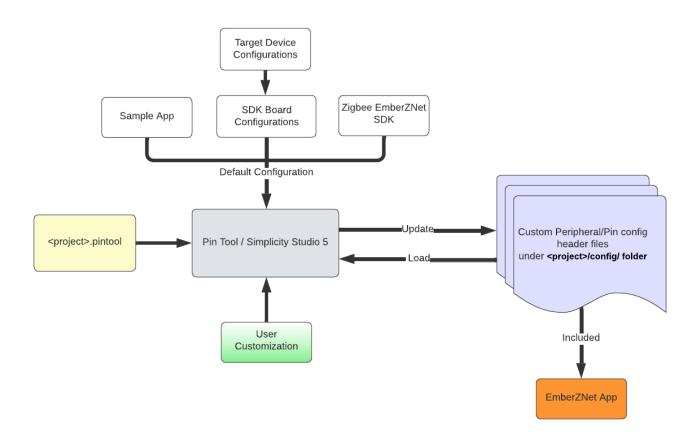

- Introducing peripheral configuration
- Using the Pin Tool in Simplicity Studio
- Pin Tool functions

1 Introduction

Pin Tool is an advanced graphical editor that allows developers to easily configure the peripherals on their Zigbee system. It provides three configuration perspectives to let the developers intuitively map physical pins and peripheral instances to software components on the target device.

Pin Tool editor is also flexible enough to be used in different development flows. The bottom-up approach lets developers start configuration with pins and connect them to functions/peripherals and then software components. However, an opposite but equally effective top-down approach lets developers starts with software component selections for peripherals and work down to peripheral functions and pins when required.

When a Zigbee application project is first created, an initial set of header files are provided to the new project based on the target board's configurations, EmberZNet SDK version, and so on, as shown in the following figure. Any subsequent customization of the peripherals can be made through the Pin Tool. Developers using EmberZet can also modify hardware options through the Component Editor. All customizations and changes through Pin Tool are updated to the configuration header files which are included by the application.

The C header files with hardware-specific configurations are used and monitored by the Pin Tool. These files can be found in the following project directory. The hardware-specific configurations are stored in the **Pin Config** section of the generated C header files.

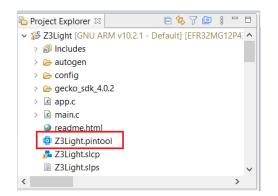

<workspace>/<project>/config/

2 Using the Pin Tool

This chapter discusses the basic operation and functions of the Pin Tool. Before proceeding to the next section, it may be helpful to understand the GPIO functionality and peripheral signal routing controls of the target devices by reviewing *AN0012: General Purpose Input Output*, device datasheets, and reference manuals.

2.1 Opening the Pin Tool in Simplicity Studio

Open Pin Tool directly by double-clicking on the <project>.pintool file in the Project Explorer, as shown in the following figure.

Pin Tool may also be started from the Project Configurator's CONFIGURATION TOOLS tab.

ight.slcp 🛛

2.2 Pin Tool Functions

The following figure shows the Pin Tool editor window once it is open. The left "Port I/O" pane shows the device package's Port I/O view. The right "Configure" has three tabs –Pin, Functions, and Peripherals. Each of these tabs gives a different detailed perspective with which to configure the hardware.

2.2.1 Port I/O Pane

The Port I/O Pane is essentially a Pinout diagram that displays the physical pin locations on the target device package.

The Pinout diagram has the following color coding:

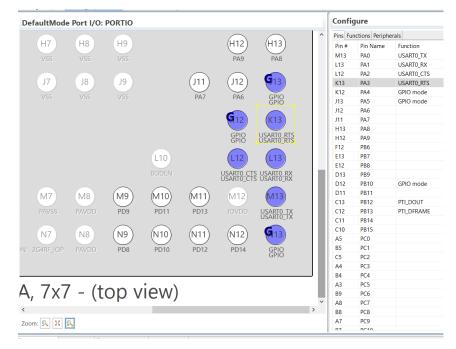

- Pins in blue are in use
- Pins in white are unused.
- Pins in red show unallowed conflicts with two or signals going into the same pin.
- Pins in orange show allowed conflicts with two or more signals going into the same pin (not shown in the diagram).
- Pins, such as E5/Vss, are greyed out because they are unavailable for configuration
- All pins configured for GPIO modes are marked by the boldfaced letter G.
- When one or more pins are selected in the Configure panel (e.g., K13), the corresponding pins are highlighted in yellow.

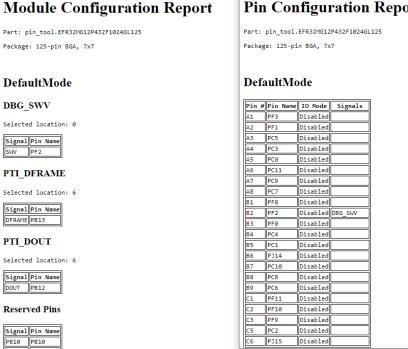

125-pin BGA, 7x7 - (top view)

The Zoom controls at the lower left corner of the Port I/O pane provide a convenient way to zoom in to a specific location on the Pinout diagram to see more detailed information of a given pin.

A printable report can be generated by right-clicking the pinout diagram and selecting Pin Configuration Report. This opens a report as a webpage in a browser that can be saved, printed, or archived. The Module Configuration Report option generates a similar set of tables organized by module rather than by pin order.

Pin Configuration Report

silabs.com | Building a more connected world.

2.2.2 Pins Tab

The Pins tab gives a **pin-centric** table view of the device, similar to the datasheet's GPIO Functionality Table. The Pins table lets the user assign any valid alternate function to a pin, as shown in the following drop-down menu under the Function column.

Configu	ire				Search: PA1	- 1
Pins Funct	tions Peripheral	s				_
Pin #	Pin Name	Function		Custom Pin Name	Software Component	
M13	PA0	USART0_TX			IO Stream: USART (vcom) : SL_IOSTREAM_USART_VCOM	C
L13	PA1	USART0_RX	~		IO Stream: USART (vcom) : SL_IOSTREAM_USART_VCOM	0
L12	PA2	TIMER0_CDTI1	^		IO Stream: USART (vcom) : SL_IOSTREAM_USART_VCOM	0
K13	PA3	TIMER0_CDTI2			IO Stream: USART (vcom) : SL_IOSTREAM_USART_VCOM	0
K12	PA4	TIMER1_CC0 TIMER1_CC1			MX25 Flash Shutdown with usart : SL_MX25_FLASH_SHUTDOW	NN.C
J13	PA5	TIMER1_CC1			Board Control : SL_BOARD_ENABLE_VCOM	c
J12	PA6	TIMER1 CC3				
J11	PA7	USART0_CLK				
H13	PA8	USART0_CS				
H12	PA9	USARTO_CTS				
F12	PB6	USART0_RTS USART0_RX				
E13	PB7	USARTO TX				
E12	PB8	USART1_CLK				
D13	PB9	USART1_CS				
D12	PB10	USART1_CTS			Board Control : SL_BOARD_ENABLE_SENSOR_RHT	0
D11	PB11	USART1_RTS USART1_RX	-			
C13	PB12	USART1_KX	~		RAIL Utility, PTI : SL_RAIL_UTIL_PTI	c
C12	PB13	PTI_DFRAME			RAIL Utility, PTI : SL_RAIL_UTIL_PTI	0
C11	PB14	_				

The Search box shown in the above figure allows user to quickly locate a Pin in a table.

Once a pin and the function have been chosen, the software component can be selected from the Software Component drop-down menu for the pin. The following figure shows the pin PA4 has been configured for GPIO mode and assigned to the software component **MX25 Flash Shutdown with usart**. Alternatively, the user can assign the pin through the Component Editor.

Configu	ire			Search: GPIO 🔗 🖉
Pins Funct	ions Peripheral	5

D13	PB9			
D12	PB10	GPIO mode	Α	dd Component
D11	PB11			
C13	PB12	PTI_DOUT		RAIL Utility, PTI : SL_RAIL_UTIL_PTI

As a convenience, the user can open the Component Editor for a given component by double-clicking the blue circle in the "Software Component" cell as shown below.

Software Component	
IO Stream: USART (vcom) : SL_IOSTREAM_USART_VCOM	0
IO Stream: USART (vcom) : SL_IOSTREAM_USART_VCOM	0
IO Stream: USART (vcom) : SL_IOSTREAM_USART_VCOM	0
IO Stream: USART (vcom) : SL_IOSTREAM_USART_VCOM	0
MX25 Flash Shutdown with usart : SL_MX25_FLASH_SHUTDOW	N. O
Board Control : SL_BOARD_ENABLE_VCOM	0

The "Custom Pin Name" column allows users to enter the custom pin name for a given pin.

2.2.3 Functions Tab

The Functions tab provides an alternate **function-centric** view of the device, similar to the datasheet's Alternate Functionality Table. The Functions tab lets the user assign available pins to an alternate function.

The valid pin for a specific alternate function can be selected from the drop-down menu in the "Pin Name" column. The blue dot for a pin in the same drop-down menu indicates the pin is already in use. The Component Editor can be opened for the entries in the "Software Component" column.

Configure			Search: GPIO	A R

ETM_TD0	PD15			
ETM_TD1	V PF2			
ETM_TD2	Disabled			

2.2.4 Peripherals Tab

The Peripherals tab shows a list of the peripherals on the device and their mapping to software components. The drop-down menu allows the user to select an available software component for a specific peripheral, as shown in the following figure.

Configure		Search: GPIO
Pins Functions Peripherals		
Peripheral	Software Component	Custom Peripheral Name
ACMP0		
ACMP1		
ADC0		
CMU		
DBG	SWO Debug : SL_DEBUG	
ETM	None	
GPIO	SWO Debug : SL_DEBUG	
12C0		
12C1	Add Component	
IDAC0		

The Software Component cell for a peripheral appears grey when no software component that uses the peripheral exists, and white when one exists but has not been assigned. The user can also provide a custom name for a given peripheral in the "Custom Peripheral Name" column.
