The BRD4258B Flex Gecko Radio Board enables developers to develop proprietary wireless applications. The board contains a dual-band Flex Gecko Wireless System-on-Chip and it is optimized for operating at 19 dBm output power. For the 2.4 GHz band with the on-board printed antenna and UFL connector, radiated and conducted testing is supported. For the 169.4 MHz band, the on-board SMA connector enables conducted testing and attachment of external whip antenna for radiated tests.

The BRD4258B Flex Gecko Radio Board plugs into the Wireless Starter Kit Mainboard, which is included with the Flex Gecko Starter Kit and gives access to display, buttons and additional features from Expansion Boards. With the supporting Simplicity Studio suite of tools, developers can take advantage of graphical wireless application development and visual energy profiling and optimization. The board also serves as an RF reference design for applications targeting 2.4 GHz and 169 MHz dual band wireless operation with 19 dBm output power.

This document contains a brief introduction and description of the BRD4258B Radio Board features, focusing on the RF sections and performance.

1. Introduction

The EFR32 Flex Gecko Radio Boards provide a development platform (together with the Wireless Starter Kit Mainboard) for the Silicon Labs EFR32 Flex Gecko Wireless System-on-Chips and serve as reference designs for the matching networks of the RF interfaces.

The BRD4258B Radio Board supports dual-band operation with its integrated sub-GHz ISM band and 2.4 GHz band transceivers. The sub-GHz section is designed to operate in the European ETSI 169.4-169.475 MHz band with an external whip antenna, the 2.4 GHz section is designed to operate at the 2400-2483.5 MHz band with the on-board printed antenna. The matching networks are optimized for operating at 19 dBm output power.

To develop and/or evaluate the EFR32 Flex Gecko, the BRD4258B Radio Board can be connected to the Wireless Starter Kit Mainboard to get access to display, buttons and additional features from Expansion Boards and also to evaluate the performance of the RF interfaces.
2. Radio Board Connector

2.1 Introduction

The board-to-board connector scheme allows access to all EFR32FG14 GPIO pins as well as the RESETn signal. For more information on the functions of the available pins, see the EFR32FG14 data sheet.

2.2 Radio Board Connector Pin Associations

The figure below shows the mapping between the connector and the EFR32FG14 pins and their function on the Wireless Starter Kit Mainboard.

![Radio Board Connector Pin Mapping](image-url)

Figure 2.1. BRD4258B Radio Board Connector Pin Mapping
3. Radio Board Block Summary

3.1 Introduction
This section gives a short introduction to the blocks of the BRD4258B Radio Board.

3.2 Radio Board Block Diagram
The block diagram of the BRD4258B Radio Board is shown in the figure below.

![Figure 3.1. BRD4258B Block Diagram](image)

3.3 Radio Board Block Description

3.3.1 Wireless MCU
The BRD4258B Flex Gecko Radio Board incorporates an EFR32FG14P233F256GM48 Wireless System-on-Chip featuring 32-bit Cortex®-M4 with FPU core, 256 kB of flash memory, 32 kB of RAM, an integrated 2.4 GHz band and an integrated sub-GHz ISM band transceiver with output power up to 19 dBm. For additional information on the EFR32FG14P233F256GM48, refer to the EFR32FG14 Data Sheet.

3.3.2 LF Crystal Oscillator (LFXO)
The BRD4258B Radio Board has a 32.768 kHz crystal mounted. For details regarding the crystal configuration, refer to Application Note "AN0016: Oscillator Design Considerations".

3.3.3 HF Crystal Oscillator (HFXO)
The BRD4258B Radio Board has a 38.4 MHz crystal mounted. For details regarding the crystal configuration, refer to Application Note "AN0016: Oscillator Design Considerations".

3.3.4 Matching Network for Sub-GHz
The BRD4258B Radio Board incorporates a sub-GHz matching network which connects both the sub-GHz TX and RX pins of the EFR32FG14 to the SMA connector to be able to transmit and receive with one antenna. The component values have been optimized for the 169.4 MHz band RF performance and current consumption with 19 dBm output power.

For a detailed description of the matching network see Chapter 4.2.1 Description of the Sub-GHz RF Matching.
3.3.5 Matching Network for 2.4 GHz

The BRD4258B Radio Board incorporates a 2.4 GHz matching network which connects the 2.4 GHz TRX pin of the EFR32FG14 to the one on-board printed inverted-F antenna. The component values have been optimized for the 2.4 GHz band RF performance and current consumption with 19 dBm output power.

For a detailed description of the matching network, see Chapter 4.2.2 Description of the 2.4 GHz RF Matching.

3.3.6 SMA Connector

To be able to perform conducted measurements or mount external antenna for radiated measurements, range tests etc., Silicon Labs added an SMA connector to the Radio Board. The connector allows an external 50 Ohm cable or antenna to be connected during design verification or testing.

3.3.7 UFL Connector

To be able to perform conducted measurements, Silicon Labs added a UFL connector to the Radio Board. The connector allows an external 50 Ohm cable or antenna to be connected during design verification or testing.

**Note:** By default, the output of the matching network is connected to the printed inverted-F antenna by a series component. It can be connected to the UFL connector as well through a series 0 Ohm resistor, which is not mounted by default. For conducted measurements through the UFL connector, the series component to the antenna should be removed and the 0 Ohm resistor should be mounted (see Chapter 4.2.2 Description of the 2.4 GHz RF Matching for further details).

3.3.8 Radio Board Connectors

Two dual-row, 0.05” pitch polarized connectors make up the BRD4258B Radio Board interface to the Wireless Starter Kit Mainboard.

For more information on the pin mapping between the EFR32FG14P233F256GM48 and the Radio Board Connector, refer to Chapter 2.2 Radio Board Connector Pin Associations.

3.3.9 Inverted-F Antenna

The BRD4258B Radio Board includes a printed inverted-F antenna (IFA) tuned to have close to 50 Ohm impedance at the 2.4 GHz band.

For detailed description of the antenna, see Chapter 4.6 Inverted-F Antenna.

3.3.10 Serial Flash

The BRD4258B Radio Board is equipped with an 8 Mbit Macronix MX25R SPI flash that is connected directly to the EFR32FG14 to support over-the-air (OTA) updates. For additional information on the pin mapping see the schematic of the BRD4258B.

3.3.11 Serial EEPROM

The BRD4258B Radio Board is equipped with a serial I²C EEPROM for board identification and to store additional board related information.
4. RF Section

4.1 Introduction
This section gives a short introduction to the RF section of the BRD4258B Radio Board.

4.2 Schematic of the RF Matching Network
The schematic of the RF section of the BRD4258B Radio Board is shown in the following figure.

![Figure 4.1. Schematic of the RF Section of the BRD4258B](image)

4.2.1 Description of the Sub-GHz RF Matching
The sub-GHz matching network connects the differential TX outputs and RX inputs of the sub-GHz RF port to the SMA connector while transforming the impedances to 50 Ohm. Careful design procedure was followed to ensure that the RX input circuitry does not load down the TX output path while in TX mode and that the TX output circuitry does not degrade receive performance while in RX mode.

The matching includes a differential impedance matching circuitry, a discrete balanced-unbalanced transformer and a filter section. The targeted output power is 19 dBm at 169.4 MHz.

4.2.2 Description of the 2.4 GHz RF Matching
The 2.4 GHz matching connects the 2G4RF_IOP pin to the on-board printed Inverted-F Antenna. The 2G4RF_ION pin is connected to ground. For higher output powers (13 dBm and above) beside the impedance matching circuitry it is recommended to use additional harmonic filtering as well at the RF output. The targeted output power of the BRD4258B board is 19 dBm. Therefore, the RF output of the IC is connected to the antenna through a four-element impedance matching and harmonic filter circuitry.

For conducted measurements, the output of the matching network can also be connected to the UFL connector by relocating the series R1 resistor to the R2 resistor position between the output of the matching and the UFL connector.

4.3 RF Section Power Supply
On the BRD4258B Radio Board the supply pin of the radio (RFVDD) is connected directly of the output of the on-chip DC-DC converter while the supply for the sub-GHz and 2.4 GHz power amplifiers (SUBGRF_ON, SUBGRF_OP and PAVDD pins) is provided directly by the Motherboard. This way, by default, the DC-DC converter provides 1.8 V for the RF analog section, the Motherboard provides 3.3 V for the PAs (for details, see the schematic of the BRD4258B).

4.4 Bill of Materials for the sub-GHz Matching
The Bill of Materials of the sub-GHz matching network of the BRD4258B Radio Board is shown in the following table.

---

**BRD4258B Reference Manual**

**RF Section**

4. RF Section

4.1 Introduction
This section gives a short introduction to the RF section of the BRD4258B Radio Board.

4.2 Schematic of the RF Matching Network
The schematic of the RF section of the BRD4258B Radio Board is shown in the following figure.

![Figure 4.1. Schematic of the RF Section of the BRD4258B](image)

4.2.1 Description of the Sub-GHz RF Matching
The sub-GHz matching network connects the differential TX outputs and RX inputs of the sub-GHz RF port to the SMA connector while transforming the impedances to 50 Ohm. Careful design procedure was followed to ensure that the RX input circuitry does not load down the TX output path while in TX mode and that the TX output circuitry does not degrade receive performance while in RX mode.

The matching includes a differential impedance matching circuitry, a discrete balanced-unbalanced transformer and a filter section. The targeted output power is 19 dBm at 169.4 MHz.

4.2.2 Description of the 2.4 GHz RF Matching
The 2.4 GHz matching connects the 2G4RF_IOP pin to the on-board printed Inverted-F Antenna. The 2G4RF_ION pin is connected to ground. For higher output powers (13 dBm and above) beside the impedance matching circuitry it is recommended to use additional harmonic filtering as well at the RF output. The targeted output power of the BRD4258B board is 19 dBm. Therefore, the RF output of the IC is connected to the antenna through a four-element impedance matching and harmonic filter circuitry.

For conducted measurements, the output of the matching network can also be connected to the UFL connector by relocating the series R1 resistor to the R2 resistor position between the output of the matching and the UFL connector.

4.3 RF Section Power Supply
On the BRD4258B Radio Board the supply pin of the radio (RFVDD) is connected directly of the output of the on-chip DC-DC converter while the supply for the sub-GHz and 2.4 GHz power amplifiers (SUBGRF_ON, SUBGRF_OP and PAVDD pins) is provided directly by the Motherboard. This way, by default, the DC-DC converter provides 1.8 V for the RF analog section, the Motherboard provides 3.3 V for the PAs (for details, see the schematic of the BRD4258B).

4.6 Inverted-F Antenna

The BRD4258B Radio Board includes an on-board printed inverted-F antenna tuned for the 2.4 GHz band. Due to the design restrictions of the Radio Board, the input of the antenna and the output of the matching network can't be placed directly next to each other. Therefore, a 50 Ohm transmission line was necessary to connect them. The resulting impedance and reflection measured at the output of the matching network are shown in the following figure. As it can be observed, the impedance is close to 50 Ohm (the reflection is around or better than -10 dB) for the entire 2.4 GHz band.
Figure 4.2. Impedance and Reflection of the Inverted-F Antenna of the BRD4258B Board Measured from the Matching Output
5. Mechanical Details

The BRD4258B Radio Board is illustrated in the figures below.

![BRD4258B Top View](image)

**Figure 5.1. BRD4258B Top View**

![BRD4258B Bottom View](image)

**Figure 5.2. BRD4258B Bottom View**
6. EMC Compliance

6.1 Introduction

Compliance of the fundamental and harmonic levels of the BRD4258B Radio Board is tested against the following standards:

- 169.4 MHz:
  - ETSI EN 300-220-1
- 2.4 GHz:
  - ETSI EN 300-328
  - FCC 15.247

6.2 EMC Regulations for 169.4 MHz

6.2.1 ETSI EN 300-200-1 Emission Limits for the 169.4-169.475 MHz Band

Based on ETSI EN 300-220-1 the allowed maximum fundamental power for the 169.4-169.475 MHz band is 500 mW (27 dBm) e.r.p. both for conducted and radiated measurements.

**Note:** Further in this document EIRP (Effective Isotropic Radiated Power) will be used instead of e.r.p. (Effective Radiated Power) for the comparison of the radiated limits and measurement results. The 500 mW e.r.p radiated limit is equivalent to 29.1 dBm EIRP.

For the unwanted emission limits see the table below.

### Table 6.1. ETSI EN 300-220-1 Spurious Domain Emission Limits in e.r.p. (and EIRP)

<table>
<thead>
<tr>
<th>Frequency</th>
<th>47 MHz to 74 MHz</th>
<th>87.5 MHz to 118 MHz</th>
<th>174 MHz to 230 MHz</th>
<th>470 MHz to 862 MHz</th>
<th>Other frequencies below 1000 MHz</th>
<th>Frequencies above 1000 MHz</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operating</td>
<td>4 nW (-54 dBm e.r.p. = -51.8 dBm EIRP)</td>
<td>250 nW (-36 dBm e.r.p. = -33.9 dBm EIRP)</td>
<td>1 uW (-30 dBm e.r.p. = -27.9 dBm EIRP)</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Standby</td>
<td>2 nW (-57 dBm e.r.p. = -54.8 dBm EIRP)</td>
<td>2 nW (-57 dBm e.r.p. = -54.8 dBm EIRP)</td>
<td>20 nW (-47 dBm e.r.p. = -44.8 dBm EIRP)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The above ETSI limits are also applied both for conducted and radiated measurements.

6.3 ETSI EN 300-328 Emission Limits for the 2400-2483.5 MHz Band

Based on ETSI EN 300-328, the allowed maximum fundamental power for the 2400-2483.5 MHz band is 20 dBm EIRP. For the unwanted emissions in the 1 GHz to 12.75 GHz domain the specified limit is -30 dBm EIRP.

6.4 FCC15.247 Emission Limits for the 2400-2483.5 MHz Band

FCC 15.247 allows conducted output power up to 1 Watt (30 dBm) in the 2400-2483.5 MHz band. For spurious emissions the limit is -20 dBc based on either conducted or radiated measurement, if the emission is not in a restricted band. The restricted bands are specified in FCC 15.205. In these bands the spurious emission levels must meet the levels set out in FCC 15.209. In the range from 960 MHz to the frequency of the 5th harmonic it is defined as 0.5 mV/m at 3 m distance which equals to -41.2 dBm in EIRP.

Additionally, for spurious frequencies above 1 GHz, FCC 15.35 allows duty-cycle relaxation to the regulatory limits. For the EmberZNet PRO the relaxation is 3.6 dB. Therefore, the -41.2 dBm limit can be modified to -37.6 dBm.

If operating in the 2400-2483.5 MHz band the 2nd, 3rd and 5th harmonics can fall into restricted bands. As a result, for those harmonics the -37.6 dBm limit should be applied. For the 4th harmonic the -20 dBc limit should be applied.
6.5 Applied Emission Limits for the 2.4 GHz Band

The above ETSI limits are applied both for conducted and radiated measurements.

The FCC restricted band limits are radiated limits only. In addition, Silicon Labs applies the same restrictions to the conducted spectrum. By doing so, in case of a custom board, assuming that an antenna is used which has 0 dB gain at the fundamental and the harmonic frequencies, the compliance with the radiated limits can be estimated based on the conducted measurement.

The overall applied limits are shown in the table below.

Table 6.2. Applied Limits for Spurious Emissions for the 2.4 GHz Band

7. RF Performance

7.1 Conducted Power Measurements

During measurements, the BRD4258B Radio Board was attached to a Wireless Starter Kit Mainboard which was supplied by USB. The voltage supply for the Radio Board was 3.3 V.

7.1.1 Conducted Measurements in the 169.4 MHz Band

The BRD4258B Radio Board was connected directly to a Spectrum Analyzer through its SMA connector. The supply for the RF section (RFVDD) was 1.8 V provided by the on-chip DCDC converter, the supply for the sub-GHz power amplifier (SUBGRF_ON, SUBGRF_OP) was 3.3 V provided by the mainboard (VBIAS through the discrete balun); for details, see the schematic of the BRD4258B. The transceiver was operated in continuous carrier transmission mode. The output power of the radio was set to 19 dBm.

The typical output spectrum is shown in the following figure.

As shown in the figure, the fundamental is a bit higher than 19 dBm so it is compliant with the 29.1 dBm fundamental limit. The unwanted emissions are under their corresponding limit, so the conducted spectrum is compliant with the regulation limits.
7.1.2 Conducted Measurements in the 2.4 GHz Band

The BRD4258B Radio Board was connected directly to a Spectrum Analyzer through its UFL connector (the R1 resistor was removed and a 0 Ohm resistor was soldered to the R2 resistor position). The supply for the RF section (RFVDD) was 1.8 V provided by the on-chip DCDC converter, the supply for the 2.4 GHz power amplifier (PAVDD) was 3.3 V provided by the mainboard; for details, see the schematic of the BRD4258B. The transceiver was operated in continuous carrier transmission mode. The output power of the radio was set to 19 dBm.

The typical output spectrum is shown in the following figure.

As shown in the figure, the fundamental is slightly lower than 19 dBm and all of the unwanted emissions are under the -37.6 dBm applied limit.

Note: The conducted measurement is performed by connecting the on-board UFL connector to a Spectrum Analyzer through an SMA Conversion Adapter (P/N: HRMJ-U.FLP(40)). This connection itself introduces approximately 0.3 dB insertion loss.
7.2 Radiated Power Measurements

During measurements, the BRD4258B Radio Board was attached to a Wireless Starter Kit Mainboard which was supplied by USB. The voltage supply for the Radio Board was 3.3 V. The radiated power was measured in an antenna chamber by rotating the board 360 degrees with horizontal and vertical reference antenna polarizations in the XY, XZ and YZ cuts. The measurement planes are illustrated in the figure below.

![Illustration of Reference Planes with a Radio Board Plugged into the Wireless Starter Kit Mainboard](image)

**Figure 7.3. Illustration of Reference Planes with a Radio Board Plugged into the Wireless Starter Kit Mainboard**

**Note:** The radiated measurement results presented in this document were recorded in an unlicensed antenna chamber. Also, the radiated power levels may change depending on the actual application (PCB size, used antenna, and so on). Therefore, the absolute levels and margins of the final application are recommended to be verified in a licensed EMC testhouse.
7.2.1 Radiated Measurements in the 169.4 MHz Band

For the 169.4 MHz radiated power measurements, an external whip antenna (P/N: EXH-170-SM (Laird Technologies)) was used as a transmitter antenna. It was connected to the SMA connector of the BRD4258B Radio Board. The supply for the RF section (RFVDD) was 1.8 V provided by the on-chip DCDC converter, the supply for the sub-GHz power amplifier (SUBGRF_ON, SUBGRF_OP) was 3.3 V provided by the mainboard (VBIAS through the discrete balun); for details, see the schematic of the BRD4258B. The transceiver was operated in continuous carrier transmission mode. The output power of the radio was set to 19 dBm.

The measured radiated powers are shown in the table below.

* Signal level is below the Spectrum Analyzer noise floor.

As shown in the table, with mounted shielding, the fundamental and all of the harmonics are compliant with the limits. Unfortunately the chosen antenna together with the relatively small ground area (compared to the wavelength), provided by the BRD4258B Radio Board and the Wireless Starter Kit Mainboard, results very poor antenna gain thus the radiated power of the fundamental is relatively low. The harmonic emissions are compliant with the limits.
For the transmitter antenna, the on-board printed inverted-F antenna of the BRD4258B Radio Board was used (the R1 resistor was mounted). The supply for the RF section (RFVDD) was 1.8 V provided by the on-chip DCDC converter, the supply for the 2.4 GHz power amplifier (PAVDD) was 3.3 V provided by the mainboard; for details, see the schematic of the BRD4258B. The transceiver was operated in continuous carrier transmission mode. The output power of the radio was set to 19 dBm based on the conducted measurement. During the measurement the sub-GHz antenna (P/N: EXH-170-SM (Laird Technologies)) was attached to the SMA connector. The radiated performance was measured with and without mounted shielding can.

The results are shown in the tables below.

</table>

* Signal level is below the Spectrum Analyzer noise floor.

As shown in the table, due to the high gain of the inverted-F antenna, the level of the fundamental is higher than 19 dBm. The harmonics are compliant with the applied limits with or without shielding.
8. EMC Compliance Recommendations

8.1 Recommendations for 169 MHz ETSI EN 300-220-1 compliance

As it was shown in the previous chapter the conducted spectrum BRD4258B Flex Gecko Radio Board is compliant with the emission limits of the ETSI EN 300-220-1 regulation with 19 dBm output power. For the radiated compliance mounting a shielding can is required due to the unwanted harmonic radiation through the matching network components and PCB traces. With mounted shielding can all of the unwanted emissions are compliant with the regulation limits.

8.2 Recommendations for 2.4 GHz ETSI EN 300-328 compliance

As it was shown in the previous chapter the radiated power of the fundamental of the BRD4258B Flex Gecko Radio Board with 19 dBm output power exceeds the 20 dBm limit of the ETSI EN 300-328 regulation due to the high antenna gain so reduction of the fundamental power is required by approximately 1 dB in order to comply. The harmonic emissions are under the -30 dBm limit with a large margin even with 19 dBm output power. Mounting a shielding can is required due to the sub-GHz compliance, but it is not required for the 2.4 GHz compliance.

8.3 Recommendations for 2.4 GHz FCC 15.247 compliance

As it was shown in the previous chapter the BRD4258B Flex Gecko Radio Board is compliant with the emission limits of the FCC 15.247 regulation with 19 dBm output power. Mounting a shielding can is required due to the sub-GHz compliance, but it is not required for the 2.4 GHz compliance.
# 9. Board Revision History

## Table 9.1. BRD4258B Radio Board Revisions

<table>
<thead>
<tr>
<th>Radio Board Revision</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A01</td>
<td>Updating EFR revision to Rev. B. Improved PCB layout.</td>
</tr>
<tr>
<td>A00</td>
<td>Initial revision.</td>
</tr>
</tbody>
</table>

**Note:** The silkscreen marking on the board (e.g. PCBxxxx A00) denotes the revision of the PCB. The revision of the actual Radio Board is laser printed in the 'Board Info' field on the PCB. Also, it can be read from the on-board EEPROM.
10. Errata

There are no known errata at present.
11. Document Revision History

Revision 1.00
2017-10-26

Initial document revision.
