

MGM210PB32 Module Radio Board BRD4308C Reference Manual

The BRD4308C Wireless Gecko Radio Board contains a Wireless Gecko module, which integrates Silicon Labs' EFR32MG22 Wireless Gecko SoC into a small form factor module. The fully certified module contains all components (a high-performance transceiver, an energy efficient 32-bit MCU, crystals, RF passives, and antenna) required for a system-level implementation of Zigbee®, Thread® Bluetooth® and multi-protocol (ZigBee + Bluetooth) networks operating in the 2.4 GHz band with 20 dBm output power.

The BRD4308C Wireless Gecko Radio Board plugs into the Wireless Starter Kit Mainboard, which is included with the Wireless Gecko Starter Kit and gives access to display, buttons, and additional features from expansion boards. With the supporting Simplicity Studio suite of tools, developers can take advantage of graphical wireless application development, mesh networking debug and packet trace, and visual energy profiling and optimization.

This document contains a brief introduction and description of the BRD4308C Radio Board features, focusing on the RF performance.

RADIO BOARD FEATURES

- Wireless Module: MGM210PB32JIA2
 - CPU core: ARM Cortex®-M33
 - Flash/RAM memory: 1024 kB/96 kB
 - Secure Vault
 - Operation frequency: 2.4 GHz
 - Transmit power: 20 dBm
 - Integrated chip antenna, RF matching network, crystals, and decoupling
- UFL connector for conducted tests

1. Introduction

The BRD4308C Radio Boards provide a development platform (together with the Wireless Starter Kit Mainboard) for the Silicon Labs Wireless Gecko modules.

By carrying the MGM210PB32 module, the BRD4308C Radio Board is designed to operate in the 2400-2483.5 MHz with the maximum of 20 dBm output power.

To develop and/or evaluate the MGM210PB32 module, the BRD4308C Radio Board can be connected to the Wireless Starter Kit Mainboard to get access to display, buttons, and additional features from expansion boards (EXP boards).

2. Radio Board Connector

2.1 Introduction

The board-to-board connector scheme allows access to all MGM210PB32 GPIO pins as well as the RESETn signal. For more information on the functions of the available pins, see the MGM210PB32 data sheet.

2.2 Radio Board Connector Pin Associations

The figure below shows the mapping between the connector and the MGM210PB32 pins and their function on the Wireless Starter Kit Mainboard.

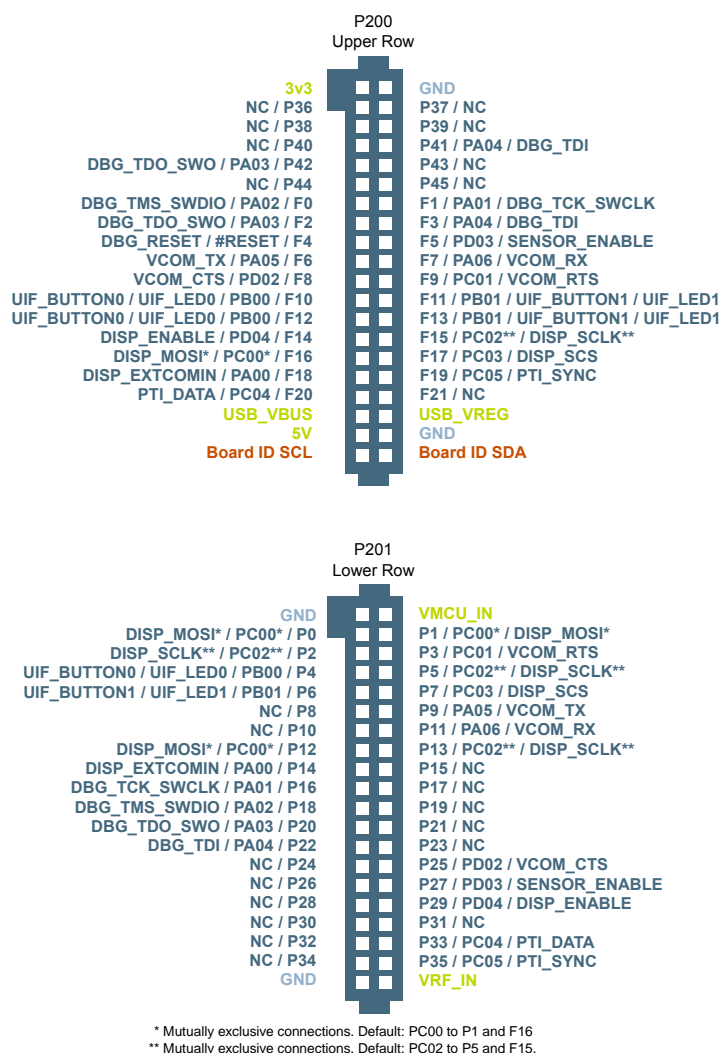

Figure 2.1. BRD4308C Radio Board Connector Pin Mapping

3. Radio Board Block Summary

3.1 Introduction

This section introduces the blocks of the BRD4308C Radio Board.

3.2 Radio Board Block Diagram

The block diagram of the BRD4308C Radio Board is shown in the figure below.

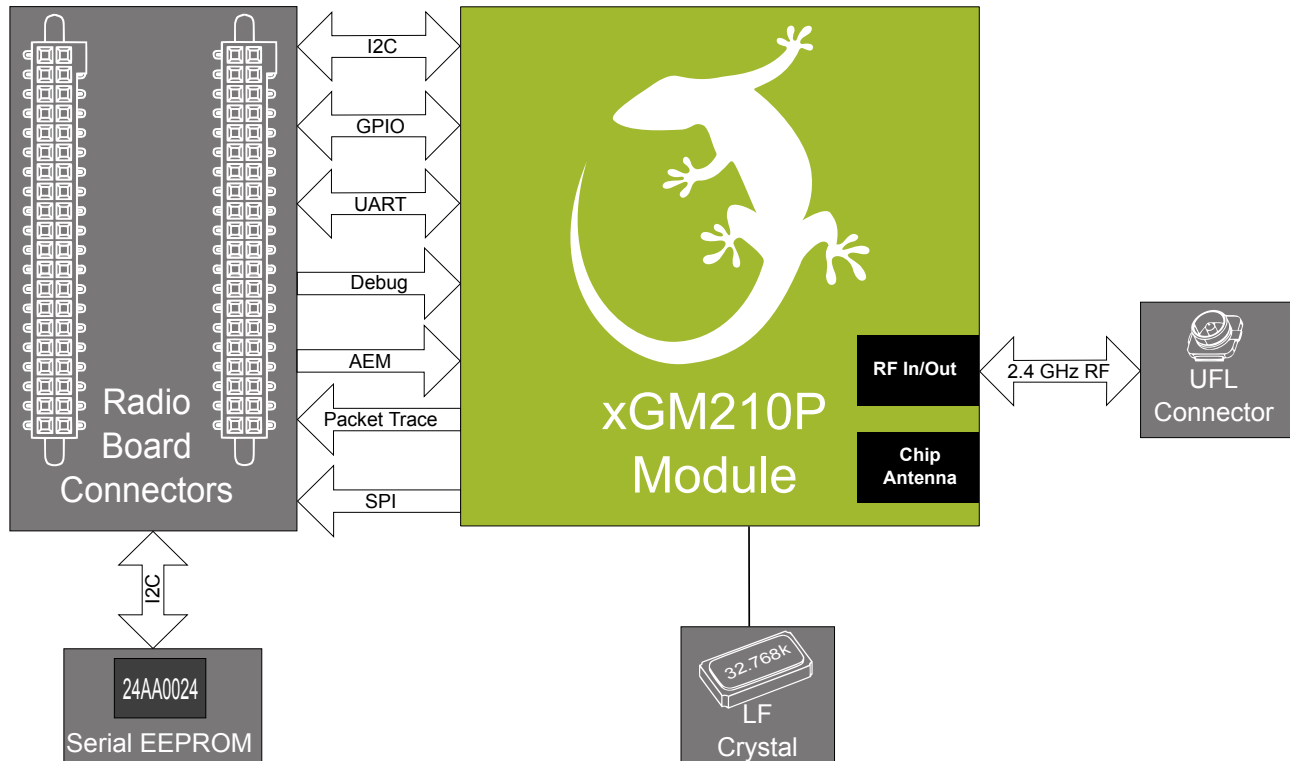

Figure 3.1. BRD4308C Block Diagram

3.3 Radio Board Block Description

3.3.1 Wireless Module

The MGM210PB32JIA2 module incorporated on the BRD4308C Wireless Gecko Radio Board features a 32-bit Cortex®-M33 core, 1024 kB of flash memory, 96 kB of RAM, crystals, and a 2.4 GHz band transceiver with RF passives and integrated antenna output power up to 20 dBm. For additional information on the MGM210PB32JIA2, refer to the MGM210P data sheet.

3.3.2 Radio Board Connectors

Two dual-row, 0.05" pitch polarized connectors make up the BRD4308C Radio Board interface to the Wireless Starter Kit Mainboard.

For more information on the pin mapping between the MGM210PB32JIA2 and the Radio Board Connector, refer to section [2.2 Radio Board Connector Pin Associations](#).

3.3.3 LF Crystal Oscillator (LFXO)

The BRD4308C Radio Board has a crystal mounted. For details regarding the crystal configuration, refer to application note [AN0016.2: Oscillator Design Considerations](#).

3.3.5 Serial EEPROM

The BRD4308C Radio Board is equipped with a serial I²C EEPROM for board identification and to store additional board-related information.

4. Mechanical Details

The BRD4308C Radio Board is illustrated in the figures below.

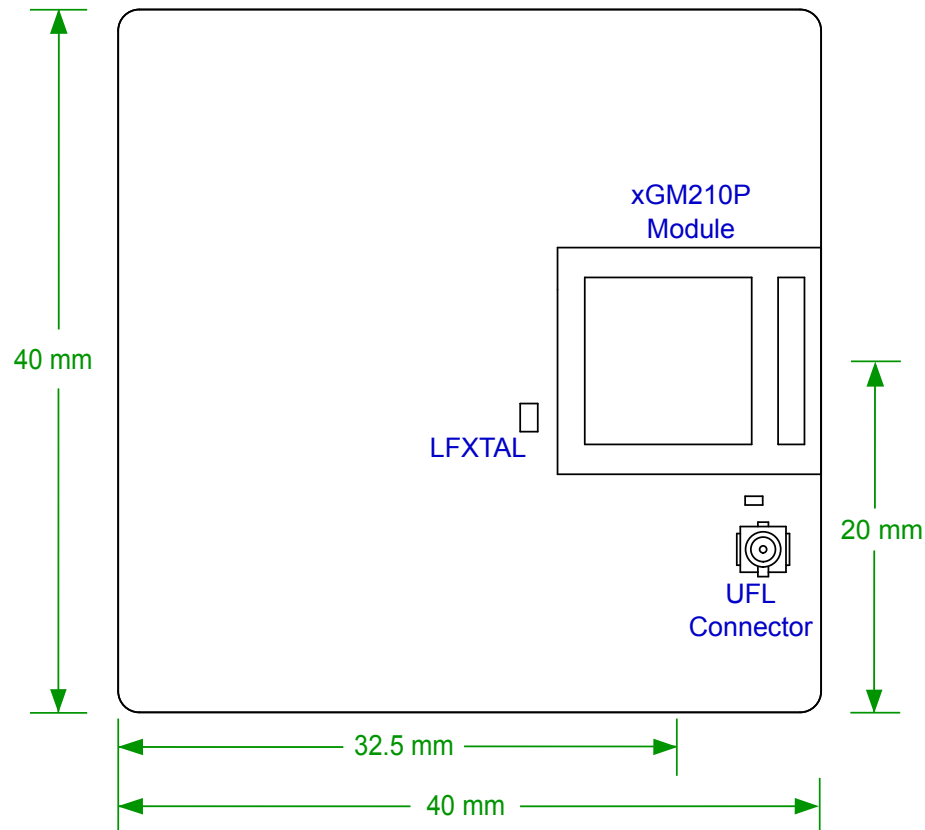

Figure 4.1. BRD4308C Top View

Figure 4.2. BRD4308C Bottom View

5. EMC Compliance

5.1 Introduction

Compliance of the fundamental and harmonic levels of the BRD4308C Radio Board is tested against the following standards:

- 2.4 GHz:
 - ETSI EN 300-328
 - FCC 15.247

5.2 EMC Regulations for 2.4 GHz

5.2.1 ETSI EN 300-328 Emission Limits for the 2400-2483.5 MHz Band

Based on ETSI EN 300-328, the allowed maximum fundamental power for the 2400-2483.5 MHz band is 20 dBm EIRP. For the unwanted emissions in the 1 GHz to 12.75 GHz domain, the specific limit is -30 dBm EIRP.

5.2.2 FCC15.247 Emission Limits for the 2400-2483.5 MHz Band

FCC 15.247 allows conducted output power up to 1 W (30 dBm) in the 2400-2483.5 MHz band. For spurious emissions, the limit is -20 dBc based on either conducted or radiated measurement, if the emission is not in a restricted band. The restricted bands are specified in FCC 15.205. In these bands, the spurious emission levels must meet the levels set out in FCC 15.209. In the range from 960 MHz to the frequency of the 5th harmonic, it is defined as 0.5 mV/m at 3 m distance which equals to -41.2 dBm in EIRP.

If operating in the 2400-2483.5 MHz band, the 2nd, 3rd, and 5th harmonics can fall into restricted bands. As a result, for those harmonics the -41.2 dBm limit should be applied. For the 4th harmonic the -20 dBc limit should be applied.

5.2.3 Applied Emission Limits for the 2.4 GHz Band

The above ETSI limits are applied both for conducted and radiated measurements.

The FCC restricted band limits are radiated limits only. In addition, Silicon Labs applies the same restrictions to the conducted spectrum. By doing so, compliance with the radiated limits can be estimated based on the conducted measurement, by assuming the use of an antenna with 0 dB gain at the fundamental and the harmonic frequencies.

The overall applied limits are shown in the table below. For the harmonics that fall into the FCC restricted bands, the FCC 15.209 limit is applied. ETSI EN 300-328 limit is applied for the rest.

Table 5.1. Applied Limits for Spurious Emissions for the 2.4 GHz Band

Harmonic	Frequency	Limit
2nd	4800~4967 MHz	-41.2 dBm
3rd	7200~7450.5 MHz	-41.2 dBm
4th	9600~9934 MHz	-30.0 dBm
5th	12000~12417.5 MHz	-41.2 dBm

6. RF Performance

6.1 Conducted Power Measurements

During measurements, the BRD4308C Radio Board was attached to a Wireless Starter Kit Mainboard which was supplied by USB. The voltage supply for the Radio Board was 3.3 V.

6.1.1 Conducted Measurements in the 2.4 GHz Band

The BRD4308C Radio Board was connected directly to a Spectrum Analyzer through the on-board UFL connector. The RF output of the module was set to the RF2G4_IO2 pin instead of the built-in antenna.

The supply for the module (VDD) was 3.3 V provided by the mainboard; for details, see the BRD4308C schematic. The transceiver was operated in continuous carrier transmission mode. The output power of the radio was set to 20 dBm.

The typical output spectrum is shown in the following figure.

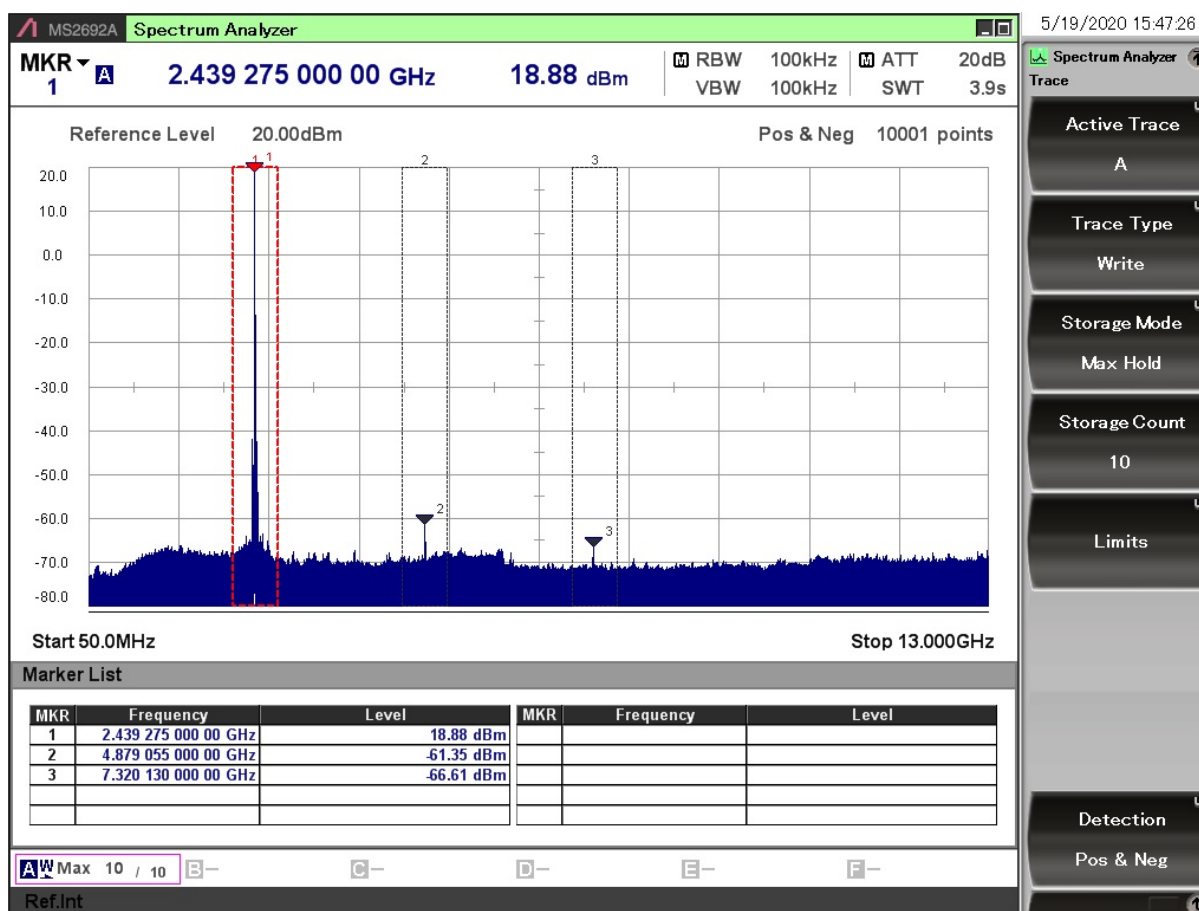

Figure 6.1. Typical Output Spectrum of the BRD4308C

As shown in the figure above, the fundamental is slightly lower than 20 dBm and all of the unwanted emissions are under the applied limits.

Note: The UFL connector introduces approximately 0.3 dB insertion loss.

6.2 Radiated Power Measurements

During measurements, the BRD4308C Radio Board was attached to a Wireless Starter Kit Mainboard which was supplied by USB. The voltage supply for the Radio Board was 3.3 V. The radiated power was measured in an antenna chamber by rotating the board 360 degrees with horizontal and vertical reference antenna polarizations in the XY, XZ, and YZ cuts. The measurement planes are illustrated in the figure below.

Figure 6.2. Illustration of Reference Planes with a Radio Board Plugged into the Wireless Starter Kit Mainboard

Note: The radiated measurement results presented in this document were recorded in an unlicensed antenna chamber. Also, the radiated power levels may change depending on the actual application (PCB size, used antenna, and so on). Therefore, the absolute levels and margins of the final application are recommended to be verified in a licensed EMC testhouse.

6.2.1 Radiated Measurements in the 2.4 GHz Band

The supply for the module (VDD) was 3.3 V provided by the mainboard; for details, see the BRD4308C schematic. The RF output of the module was set to the built-in antenna. The transceiver was operated in continuous carrier transmission mode. The output power of the radio was set to 20 dBm based on the conducted measurement.

The fundamental was set to the frequency where the maximum antenna gain was measured. The results are shown in the table below.

Note: The frequency in which the antenna gain has its maximum value can vary between modules due to the technological spreading of the passive RF components and the antenna.

Table 6.1. Maximums of the Measured Radiated Powers in EIRP [dBm]

Frequency (2440 MHz)	EIRP [dBm]	Orientation	Margin [dB]	Limit in EIRP [dBm]
Fund	19.7	XY/H	10.3	30.0
2nd	-49.7	XZ/V	8.5	-41.2
3rd	-43.5	YZ/H	2.2	-41.2
4th	<-50*	-/-	>20	-30.0
5th	<-50*	-/-	>10	-41.2

* Signal level is below the Spectrum Analyzer noise floor.

As shown in the table above, due to the antenna gain, the fundamental is slightly higher than the output power based the conducted measurement. The harmonics are below the applied limits.

6.2.2 Antenna Pattern Measurements

The measured normalized antenna patterns are shown in the following figures.

Figure 6.3. Normalized Antenna Pattern of the BRD4308C with the Wireless Starter Kit Mainboard

7. EMC Compliance Recommendations

7.1 Recommendations for 2.4 GHz ETSI EN 300-328 Compliance

As shown in section [6.2 Radiated Power Measurements](#), the power of the fundamental frequency of the BRD4308C Wireless Gecko Radio Board with 20 dBm output is compliant with the 20 dBm limit of the ETSI EN 300-328 regulation in both the conducted and radiated measurements. The harmonic emissions are under the -30 dBm limit with large margin.

7.2 Recommendations for 2.4 GHz FCC 15.247 Compliance

As shown in section [6.2 Radiated Power Measurements](#), the power of the fundamental frequency of the BRD4308C Wireless Gecko Radio Board with 20 dBm output is compliant with the 30 dBm limit of the FCC 15.247 regulation. The harmonic emissions are under the applied limits.

8. Board Revision History

The board revision is laser engraved in the Board Info field on the bottom side of the PCB, as outlined in the figure below. The revision printed on the silkscreen is the PCB revision.
