Z-Wave and Z-Wave Long Range 700 SDK 7.15.1.0 Pre-Cert GA
Gecko SDK Suite 3.1
December 9, 2020

Z-Wave and Z-Wave Long Range 700 are designed to meet the demands of the future smart home, where increasing needs for more sensors and battery-operated devices require both long range and low power. Context-aware environments are the next evolution in the smart home market, and they require technologies that have been optimized specifically for these applications.

100% Interoperable: Every product in the Z-Wave ecosystem works with every other product, regardless of type, brand, manufacturer or version. No other smart home/IoT protocol can make this claim.

Best-In-Class Security: Z-Wave’s Security 2 (S2) framework provides end-to-end encryption and the most advanced security for smart home devices and controllers. Homes with S2 Z-Wave devices are virtually un-hackable.

SmartStart Easy Installation: SmartStart radically simplifies the installation of smart devices by using QR code scans for uniform, trouble-free setup. Devices and systems can be pre-configured dramatically easing deployments.

Backwards-Compatible: Z-Wave certification mandates backward-compatibility. The very first Z-Wave devices on the market, more than ten years old still perform as intended in networks with the latest Z-Wave technologies.

The Z-Wave and Z-Wave Long Range 700 SDK v7.15.1 Pre-Cert GA release can't be used for Z-Wave certification, see section 6 Product Life Cycle and Certification.

These release notes cover SDK version(s):

7.15.1.0 Pre-Cert GA released December 9, 2020

Compatibility and Use Notices

If you are new to the Z-Wave 700 SDK, see Using This Release.

1 Z-Wave Protocol

1.1 New Items

This release now supports the Z-Wave Long Range (LR) specification that allows for up to +30 dBm, more than 4,000+ node network support, up to 10-year coin cell battery life, and maintains Z-Wave backward compatibility and interoperability.

The Z-Wave Long Range 700 delivers up to 1-mile outdoor line-of-sight range achieved at +14 dBm output power. Furthermore, it brings Z-Wave beyond the home into larger properties and multi-dwelling units.

1. Increased Coverage
   Z-Wave 700 with LR devices enable wireless coverage beyond the yard, resulting in complete home or building area coverage with no need for repeaters. Z-Wave LR eliminates the need for network repeaters/mesh by increasing the transmission range found between Z-Wave devices up to 1 mile when using Z-Wave 700, with the potential for even longer range with additional external amplification. The increased range unlocks new potential for Z-Wave networks beyond the home and into larger properties such as hotels and multi-dwelling units (MDU), while making it easier than ever before to enroll IoT devices deployed at the end of the yard or beyond for enhanced functionality.

2. Increased Scalability
   As the average number of installed smart home devices continues to increase, so too does the strain on the network. To support the upward trend in the number of sensor and IoT devices within homes and MDU environments, the Z-Wave 700 with LR currently increases scalability on a single IoT network up to 1,000 nodes, with future support for 4,000+ nodes coming soon.

3. Optimized Battery Life with Dynamic Transmit Power Control
   Dynamic transmit power control of every transmission optimizes the current draw based on practical range needs after taking into account noise floor and information on additional interferers. Z-Wave LR does not waste any power and increases the battery lifetime, enabling typical sensor use cases with up to 10 years on a coin cell battery.

4. Interoperable and Backwards Compatible
   Z-Wave 700 with LR devices (ZGM130S, EFR32ZG14) go through same Z-Wave Plus V2 certification program as Z-Wave devices, enabling them to be installed within any existing Z-Wave network. These devices feature interoperability and backwards compatibility with any previously installed Z-Wave device. The Wave Long Range functionality requires both an end node and a gateway/controller to support Long Range. All Z-Wave Long Range based devices only support SmartStart as inclusion method and S2 Authenticated is the lowest class key allowed. However, Z-Wave Long Range currently only supports the US market.

5. Addressing New Markets
   Z-Wave 700 with LR makes it possible to extend robust, scalable Z-Wave wireless connectivity to MDU, hospitality and commercial uses cases, as well as large public venue networks such as airports, stadiums and arenas.

6. Certification
   The Z-Wave 700 devices with LR will be certified under the Z-Wave Plus V2 certification program starting Q1 2021.

1.2 Improvements

None

1.3 Fixed Issues

Fixed in release 7.15.1.0 Pre-Cert GA

<th>Description</th>
<th>Workaround</th>
</tr>
</thead>
<tbody>
<tr>
<td>386208</td>
<td>Sensor PIR does not always generate SHORT_PRESS events for short button presses in EM4. If the device has been awakened by a button press, the button handling logic starts by looking at the current state of the button. If the button is UP, a SHORT_PRESS event is immediately sent to the application. If the button is DOWN, then the de-bouncing logic is triggered to properly generate HOLD or LONG_PRESS events as needed. However, this leaves a tiny timing window where the button could be DOWN when initially tested, but is released before the DOWN time required for the de-bouncing logic to generate even a SHORT_PRESS event.</td>
<td>Prolong button press to allow detection of SHORT_PRESS by the de-bouncing logic.</td>

5 Using This Release

This release contains the following

- Z Wave Plus V2 Application Framework
- Z-Wave Certified Applications for a broad range of smart home applications
- Z-Wave Protocol and Serial API Applications

If you are a first-time user, Z-Wave documentation is installed with the SDK. See INS14280: Z-Wave 700 Getting Started for End Devices, INS14278: How to Use Certified Apps in Z-Wave 700, and INS14281: Z-Wave 700 Getting Started for Controller Devices for instructions.

This SDK depends on a Gecko Platform. The Gecko Platform code provides functionality that supports protocol plugins and APIs in the form of drivers and other lower layer features that interact directly with Silicon Labs chips and modules. Gecko Platform components include EMLIB, EMDRV, RAIL Library, NVM3, and mbedTLS. Gecko Platform release notes are available through Simplicity Studio’s Launcher Perspective.

5.1 Installation and Use

Order a Z-Wave 700 Wireless Starter kit. The kit offers the easiest and fastest way to start evaluation and development of your own Z-Wave 700 mesh application. It provides a single world-wide development kit for both end devices and gateways with multiple radio boards, in which to enable developers to create a mesh network and evaluate the Z-Wave 700 module.

Download and install Simplicity Studio from https://www.silabs.com/support/getting-started/mesh-networking/z-wave/z-wave-700. Installation instructions are available in the Simplicity Studio 5 User’s Guide. Simplicity Studio ensures that most software and tool compatibilities are managed correctly. Install software and board firmware updates promptly when you are notified.

After Simplicity Studio installs, select Install By Product Group, check Z-Wave, and follow the steps to install the SDK.

Documentation specific to the SDK version is installed with the SDK. API references and other information about this and earlier releases are available on https://docs.silabs.com/.

To implement a specific application, Silicon Labs recommends starting with one of the existing pre-certified apps with the desired Role Type.

5.2 Support

Development Kit customers are eligible for training and technical support.

See support resources and contact Silicon Laboratories support at http://www.silabs.com/support.
6  Product Life Cycle and Certification

Silicon Labs will add new features based on market requirements and continuously improve the Z-Wave Protocol to position the Z-Wave Ecosystem. The Z-Wave Protocol Life Cycle is a process to provide rapid innovation, new features, and robust matured protocol release to Z-Wave Partners. The Z-Wave Protocol Life Cycle defines the maturation process of Z-Wave Protocol generations and consist of three phases divided in five Life Cycle stages.

Ascent Phase (BETA)

Silicon Labs releases new Z-Wave protocol generations (branches), i.e., initial BETA release of a Z-Wave Protocol generation that will introduce major new features/functions or support for a new Z-Wave Single Chip generation. This release is not certified and not eligible for certification.

Maturity Phase (ACTIVE/MAINTAINED)

Each new generation will generate follow-on matured releases to resolve protocol issues prioritized by Silicon Labs and based on input from Z-Wave Alliance Partners.

Decline Phase (MONITORED/OBSOLETE)

After a period of 17-24 months in the maturity phase a branch/release is discontinued and for an additional period (up to 24 months) a discontinued branch/release will be monitored since products based on this branch may still be shipping or under warranty in the field.

</table>
A change in the Z-Wave SDK utilized for a specific device does require recertification; however, the type of certification required, the amount of testing needed, and the associated fees depend on the scope of the change.
