The Gecko Platform provides infrastructure support for applications developed with higher-level protocols, and it provides an interface with the underlying hardware. It is composed of the following modules:

**CMSIS Device** is a vendor-independent hardware abstraction layer for the Cortex®-M processor series.

**Peripherals** provides a complete peripheral API for all Silicon Labs EFM32, EZR32 and EFR32 MCUs and SoCs.

**Drivers** is the Gecko Platform driver library for EFM32, EZR32 and EFR32 on-chip peripherals. Drivers are typically DMA-based and use all available low-energy features.

**Services** includes common services such as NVM3 and Power Manager.

**CPC (Co-Processor Communication)** provides a library to communicate between two processors using a serial link. CPC is used by the ACP & RCP solutions

**Common** components are used throughout the SDKs.

**Middleware** includes the Capacitive Sensing Firmware Library and the GLIB graphics library, along with Micrium OS stacks like CAN/CANopen, File System, Networking and USB Device and Host.

**Security** includes mbed TLS and other security services.

**Operating System** includes Micrium OS Kernel as well as other things related to Operating Systems such as a CMSIS-RTOS2 layer.

The **Gecko Bootloader** is a code library configurable through Simplicity Studio’s IDE to generate bootloaders that can be used with a variety of Silicon Labs protocol stacks. The Gecko Bootloader can be used with EFM32 and EFR32 Series 1 and later devices.

**MVP Math Library** includes Real and Complex Matrix and Vector operations using the Matrix Vector Processor available on EFR32xG24. The library is an alternative to CMSIS-DSP for Matrix and Vector math operations.

**Examples** are example applications illustrating platform functionality.

**Boards and External Devices** cover supported hardware.

**Other Gecko Platform Components** regroups changes to documentation, project building and configuration, as well as any other aspects related to Gecko Platform.

**RAIL (Radio Abstraction Interface Layer)** provides a customizable radio interface layer that supports proprietary or standards-based wireless protocols. RAIL use by application protocols such as Silicon Labs Zigbee or Silicon Labs Connect is managed through the stack library. Direct RAIL use is exposed through the Flex SDK.

These release notes cover SDK version(s):

Gecko Platform 4.4.0.0 released December 13, 2023

1 Upcoming GSDK Changes

This release of the Gecko SDK (GSDK) will be the last with combined support for all EFM and EFR devices, except for patches to this version as needed. Starting in mid-2024 we will introduce separate SDKs:

- The existing Gecko SDK will continue with support for Series 0 and 1 devices.
- A new SDK will cater specifically to Series 2 and 3 devices.

The Gecko SDK will continue to support all Series 0 and 1 devices with no change to the long-term support, maintenance, quality, and responsiveness provided under our software policy.

The new SDK will branch from Gecko SDK and begin to offer new features that help developers take advantage of the advanced capabilities of our Series 2 and 3 products.

This decision aligns with customer feedback, reflecting our commitment to elevate quality, ensure stability, and enhance performance for an exceptional user experience across our software SDKs.
2 CMSIS Device

2.1 New Items

None

2.2 Improvements

None

2.3 Fixed Issues

Fixed in release 4.4.0.0

<table>
<thead>
<tr>
<th>ID #</th>
<th>Description</th>

2.4 Known Issues in the Current Release

None

2.5 Deprecated Items

None

2.6 Removed Items

None
3 Peripherals

3.1 New Items

**Added in release 4.4.0.0**

- Peripheral: Renamed APIs of low-level drivers in platform/peripheral(dcdc_coulomb_counter, etampdet, keyscan and sysrtc) from "sl_xxx" to "sl_hal_xxx". For example, sl_keyscan_init convert to sl_hal_keyscan_init. A compatibility layer is added so users can still use the old APIs in their application.
- em_timer: Added Reload-Start Sets Compare Output initial State rssCoist bit to TIMER_Init initialization structure.
- em_eusart: Added a watermark setting for EUART/EUSART in UART mode for users to configure the interrupt and status level of the transmit or receive FIFO.
- em_acmp: Added missing the EXTPx values to ACMP_Channel_TypeDef structure.
- em_eusart: Added auto UART TX delay transmission configuration.

3.2 Improvements

**Changed in release 4.4.0.0**

- em_vdac: Updated default settings for ondemand clock and refreshperiod, which were not the same as the default registers setting for VDAC_INIT_DEFAULT on series 2.
- em_cmu: Added Port check available for routing of the HF clock 0 and 1 to GPIO.

3.3 Fixed Issues

**Fixed in release 4.4.0.0**

<table>
<thead>
<tr>
<th>ID #</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1219359</td>
<td>em_eusart: Fixed missing support for C++.</td>
</tr>
<tr>
<td>1207190</td>
<td>em_core: Fixed missing dependency between components: when interrupt max disablement time was enabled, the cycle_counter driver must be added to the project. Otherwise, the compilation fails. To avoid this dependency the feature of cycle_counter is reimplemented in the em_core component to measure interrupt disable time.</td>
</tr>
<tr>
<td>1198594</td>
<td>em_msc: Fixed a bug in MSC_LockGetLocked function with GSDK 4.3.1 returning an invalid lock state leading to crash.</td>
</tr>
<tr>
<td>1160824</td>
<td>em_cmu: Added a return value to the CMU_HFXOCTuneSet() function. The application can check this value to see if the initialization parameter is valid or not.</td>
</tr>
<tr>
<td>1015203</td>
<td>em_lesense: Fixed the width of the structure for the storeCntRes bitfield in the LESENSE module.</td>
</tr>
<tr>
<td>177981</td>
<td>em_i2c: Fixed I2C_CR_MAX which affects the I2C clock equation.</td>
</tr>
<tr>
<td>1210216</td>
<td>em_iadc: Fixed high speed mode handling on devices family that has this mode, by correcting the maximum clock frequency computation.</td>
</tr>
<tr>
<td>1182892</td>
<td>Fixed missing C++ support in platform/emlib (added missing C linkage directive in headers).</td>
</tr>
</tbody>
</table>

4.4 Known Issues in the Current Release

None

4.5 Deprecated Items

None

4.6 Removed Items

None
5 Services

5.1 New Items

Added in release 4.4.0.0
- Token Manager: Token specific APIs have been added to access the value of tokens.

5.2 Improvements

Changed in release 4.4.0.0
- In IOSTream retarget STDIO, the assert on error status has been removed for a more adaptable behavior.
- Device Init DPLL: Added a validation script to correlate HFXO and DPLL Frequency and display a warning if they are incompatible.
- Sleeptimer: Updated the API function sl_sleeptimer_get_remaining_time_of_first_timer() to be more generic so that applications can use it to know how much time is left before the next wakeup event regardless of the Sleeptimer object type.

5.3 Fixed Issues

Fixed in release 4.4.0.0

<table>
<thead>
<tr>
<th>ID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1207966</td>
<td>Power Manager: Fix for DPLL that is not re-enabled after exiting from EM2 on the series 2 EFR32xG27. On EFR32xG27, the DPLL is disabled automatically when entering EM2, EM3. But exiting EM2, EM3 will not re-enable the DPLL automatically. Therefore, the software needs to re-enable the DPLL upon EM2 or EM3 exit. The local function dpllState() (em_emu.c) is called from EMU_Save() and EMU_Restore() to handle the DPLL state before entering EM2 or EM3 and after exiting EM2 or EM3. dpllState()-related code was not activated for EFR32xG27.</td>
</tr>
<tr>
<td>1220224</td>
<td>Device Init DPLL: Updated the default DPLL mode to cmuDPLLLockMode_Phase. Configured this way the frequency error will tend to 0, but the overshoot may be more important than with cmuDPLLLockMode_Freq. The previous default configuration (cmuDPLLLockMode_Freq) was causing some issues with certain applications requiring very precise frequency (Proprietary protocols or BLE).</td>
</tr>
<tr>
<td>1182892</td>
<td>Fixed missing C++ support in platform/service (added missing C linkage directive in headers).</td>
</tr>
</tbody>
</table>

5.4 Known Issues in the Current Release

None

5.5 Deprecated Items

None

5.6 Removed Items

None
6 CPC

6.1 New Items

**Added in release 4.4.0.0**

- First GA-quality release of CPC NVM3 module, which serves as a software component crafted to empower a Host device in leveraging the Non-Volatile Memory (NVM3) software of a Secondary device for the purpose of persistent data storage.
- Introducing the experimental version of CPC Primary, enabling communication between an MCU and a CPC Secondary device.
- Divided `sl_cpc_open_user_endpoint()` into two distinct APIs: `sl_cpc_user_endpoint_init()` and `sl_cpc_listen_endpoint()`. Note that the use of `sl_cpc_open_user_endpoint()` is slated for deprecation. Transitioning to the new APIs is recommended for future implementations.
- Separated `sl_cpc_close_endpoint()` into two distinct APIs: `sl_cpc_terminate_endpoint()` and `sl_cpc_free_endpoint()`. It is important to note that the use of `sl_cpc_close_endpoint()` is marked for deprecation. Transitioning to the new APIs is recommended for future implementations.

6.2 Improvements

**Changed in release 4.4.0.0**

CPC has evolved to a connection-oriented protocol for endpoints, streamlining the determination of the connection status with remote endpoints. Notably, CPCd maintains backward compatibility with the previous version (Protocol V4), ensuring a smooth transition for existing implementations.

- In CPCd, eliminated dependency on sysfs or libgpiod for GPIO control.
- Restricted Libcpc APIs from being called in the reset callback.
- Enhanced the libcpc reset callback to consistently detect CPCd exits, ensuring detection even when the process is not blocked on a file descriptor or hasn't called a CPC API previously.
- Removed the limitation of one application process/libcpc per CPCd instance, providing increased flexibility and scalability.
- Adjusted CPC-GPIO-Expander Bridge dependency to reference the Rust libcpc bindings for CPCd 4.3.0.
- Optimized back pressure in CPC-GPIO-Expander Bridge for improved performance.
- Removed the multi-instance limitation for CPC-GPIO-Expander, allowing for more flexible and scalable usage.
- Enhanced CPC-GPIO-Expander logging to distinguish between different instances, providing clearer and more detailed information.
- Reduced CPC Secondary RAM Usage.
- Improved `sl_cpc_write()` to automatically block until resources are available (when using a kernel), eliminating the need for the application to handle the SL_STATUS_NO_MORE_RESOURCE error.

6.3 Fixed Issues

**Fixed in release 4.4.0.0**

<table>
<thead>
<tr>
<th>ID #</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1219851</td>
<td>Resolved issues with CPCd on big-endian platforms.</td>
</tr>
<tr>
<td>1219510</td>
<td>Addressed potential segmentation fault in the UART validator of CPCd.</td>
</tr>
<tr>
<td>1212501</td>
<td>Fixed a race condition in cpc-gpio-expander/driver that occurs when a gpio chip is being removed while there is an ongoing gpio request.</td>
</tr>
<tr>
<td>1037832</td>
<td>Resolved a libcpc case where, if no reset_callback was provided to cpc_init, the application process would forcefully exit upon secondary reset.</td>
</tr>
<tr>
<td>1225166</td>
<td>Resolved, in CPC-GPIO-Expander, a concurrency issue that could lead to driver panics during exit cleanup or bridge initialization.</td>
</tr>
<tr>
<td>1218657</td>
<td>Capped SPI Bus frequency at 4 MHz to prevent peripheral incompatibility, especially when the bootloader utilizes a USART and CPC EUSART.</td>
</tr>
</tbody>
</table>
6.4 Known Issues in the Current Release
None

6.5 Deprecated Items

Deprecated in release 4.4.0.0

- `sl_cpc_open_user_endpoint()` is now deprecated. Transition to using `sl_cpc_terminate_endpoint()` and `sl_cpc_free_endpoint()` for future implementations.
- `sl_cpc_close_endpoint()` is now deprecated. Transition to using `sl_cpc_user_endpoint_init()` and `sl_cpc_listen_endpoint()` for future implementations.

9 Security

9.1 New Items

**Added in release 4.4.0.0**

- Updated the Mbed TLS library to version 3.5.0.
- Various fixes and updates. See the official changelog at https://github.com/Mbed-TLS/mbedtls/releases/tag/mbedtls-3.5.0.
- Added SLC components for enabling EC J-PAKE and PBKDF2 in PSA Crypto.
- In the SE Manager API, added functions for entering and exiting active mode on HSE based devices (xG21, xG23, xG24, xG25, xG28)

9.2 Improvements

None

9.3 Fixed Issues

**Fixed in release 4.4.0.0**

<table>
<thead>
<tr>
<th>ID #</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1184675, 1184678</td>
<td>Fixed vulnerabilities in TrustZone secure services that allowed zero-length buffers to bypass parameter validation for IO buffers (IOVECs), allowing an attacker to potentially overwrite secure memory. Affected secure services are PSA Attestation service (Vault High only), SE Manager and NVM3. Affected devices are xG21, xG22, xG23, xG24, xG25, xG27, xG28. All GSDK versions with TrustZone support are affected.</td>
</tr>
<tr>
<td>1211537</td>
<td>For all PSA cipher drivers, in the sli_psa_validate_pkcs7_padding function, improved the implementation of time constant PKCS#7 padding handling for AES-CBC through PSA Crypto. Affected devices are xG1, xG11, xG12, xG13, xG14, xG21, xG22, xG23, xG24, xG25, xG27, xG28. Affected SDK versions are 4.3.2 and earlier.</td>
</tr>
<tr>
<td>1214862</td>
<td>Fixed an issue where the use of Link Time Optimization (LTO) could result in faulty code being generated for xG27 devices using PSA Crypto. The faulty code would result in a hard fault being triggered during the platform initialization routine. Affected device is xG27. Affected SDK versions are 4.3.2 and earlier.</td>
</tr>
<tr>
<td>1175222</td>
<td>In the EMLIB module, em_crypto.c (for series-1), renamed variables with the same name in the function CRYPTO_SHA_1 function, which caused GCC to report a build error when called with option -Werror=shadow. The issue is not known to cause any different behavior. Affected are series-1 based devices, xG1, xG11, xG12, xG13, xG14. Affected SDK versions are 4.3.2 and earlier.</td>
</tr>
<tr>
<td>1202804</td>
<td>In the CRYPTO PSA driver (for series-1), renamed variables with the same name in the static function sli_ccm_starts which caused GCC to report a build error when called with option -Werror=shadow. The issue is not known to cause any different behavior. Affected are series-1 based devices, xG1, xG11, xG12, xG13, xG14. Affected SDK versions are 4.3.2 and earlier.</td>
</tr>
<tr>
<td>691903</td>
<td>In the SE Manager GCM API, renamed variables with the same name in the function sl_se_gcm_multipart_starts, which caused GCC to report a build error when called with option -Werror=shadow. <table>
<thead>
<tr>
<th>ID #</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>830108</td>
<td>AES CTR STREAM BLOCK CFG component is now a part of the bootloader. The size of the stream block counter can be set by configuring this component. This is configurable, with 1, 2, 4, and 8-block options available. Decrypting GBL data takes less time as block size increases. The potential consequences of this improvement are as follows: Currently &quot;pre-computing&quot; additional keystream bytes for CTR and putting them in a RAM-accessible struct within the bootloader parser. Previously, it could only save as much as 16 bytes of keystream, but now that number may grow to 128. The key is not exposed, thus it is still difficult to forecast the next keystream, but the more bytes are stored, the greater risk becomes.</td>
</tr>

16 RAIL Library

16.1 New Items

**Added in release 4.4.0.0**

- Added support for a new assert, which will be thrown if the loaded PHY is not supported by the software-defined modem on the EFR32xG2x.
- Added new RAIL_GetAutoAckFifo() API and allow NULL for RAIL_WriteAutoAckFifo() or RAIL_IEEE802154_WriteEnhAck() ackData parameter, which gives applications direct access to the AutoAck FIFO to construct Ack packets in pieces.
- Added support for antenna selection through the applicable RAIL_RxOptions_t and RAIL_TxOptions_t values when using OFDM on the EFR32xG25.
- Added a new "RAIL Utility, SFM Sequencer Image Selection" component to allow selection of modulations supported by EFR32xG25 software modem (SFM). These changes can save considerable flash space by reducing the set of modulations to just those that are needed.
- Added support for Sidewalk PHYs on the EFR32xG23 and EFR32xG28 chips.
- Added an assert RAIL_ASSERT_INVALID_XTAL_FREQUENCY on the EFR32xG1x and EFR32xG2x chips, to fire when a radio config that is loaded is incompatible with a device due to the defined crystal frequency of the config not matching with the device's crystal frequency.
- Added the RAIL_TX_REPEAT_OPTION_START_TO_START option to measure the delay between repeated transmits from the start of TX to start of TX instead of the default from end of TX to start of TX.
- Added support for GCC 12.2.1 and IAR 9.40.1 compilers.
- Added support for Fast Channel Switching PHYs on the EFR32xG24.
- Added support for RAIL_IEEE802154_SUPPORTS_G_MODESWITCH on the EFR32xG28.
- Added support for the IEE802154 2.4 GHz coherent PHYs via RAIL_SUPPORTS_IEEE802154_BAND_2P4 on the EFR32xG28.
- Added a new RAIL_RxOptions_t option to enable collision detection on the EFR32xG25. Once enabled, when a collision with a strong enough packet is detected, the demod will stop the current packet decoding and try to detect the preamble of the incoming packet.
- Added support of RAILTEST for the MGM240x modules.
- Added support for channel masks during Wi-SUN mode switch in RAILTEST application on the EFR32xG25.
- Added support of 802.15.4 IMM-ACK with OFDM and OQPSK modulations (FCS 4 bytes only) on the EFR32xG25.
- Updated the RAIL Library component to include the "RAIL Utility, Built-in PHYs Across HFXO Frequencies" component automatically to better support different HFXO frequencies on supported parts.

16.2 Improvements

**Changed in release 4.4.0.0**

- Updated the default PTI rate to 3200000 bps on the EFR32xG25.
- No longer include rail_chip_specific.h and rail_features.h (anything dependent on em_device.h) when SLI_LIBRARY_BUILD is defined. This will allow the user to build their radio code in a way that depends on RAIL generically but is not chip-specific. When doing this the code cannot depend on things that are inherently chip-specific and are still in those files like RAIL_RF_PATHS, RAIL_NUM_PA, or any of the compile-time RAIL_SUPPORTS_xxx defines. Code will need to call appropriate runtime APIs or split itself between the generic and chip specific portions and build them separately.
- To better support chip-agnostic builds RAIL_TxPowerMode_t is now a superset representing all possible PAs across all chips. Any code depending on the number of or consecutive ordering of chip-supported PAs will likely need to be updated.
- To better support chip-agnostic builds RAIL_CalValues_t and subordinate RAIL_IrCalValues_t have grown to encompass the superset of fields needed on all chips, affecting all chips except EFR32xG25.
- To better support chip-agnostic builds RAIL_TransitionTime_t and therefore RAIL_StateTiming_t have grown to a superset type, affecting EFR32xG1.
To better support chip-agnostic builds RAIL_FIFO_ALIGNMENT is now universally 32-bit, affecting EFR32xG1x and EFR32xG21, but is still only enforced on chips actually requiring that alignment.

- Updated the default power curves for the 10dBm High Power PA on EFR32xG24.

### 16.3 Fixed Issues
Fixed in release 4.4.0.0

<table>
<thead>
<tr>
<th>ID #</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1079816</td>
<td>Fixed a race condition on the EFR32xG22 and later during RX channel hopping or duty-cycling where frame detection occurring close to when a hop should happen could leave the radio stuck in reception but not receiving anything, with the only remedy being to idle the radio.</td>
</tr>
<tr>
<td>1088439</td>
<td>Fixed an issue which would cause the incorrect antenna to be reported for a received packet on the EFR32xG25 when using OFDM and antenna diversity.</td>
</tr>
<tr>
<td>1153679</td>
<td>Fixed an issue in &quot;RAIL Utility, Coexistence&quot; component on the EFR32xG24 where a GRANT signal pulse less than 100us might result in the radio not being properly placed in hold off after GRANT is deasserted.</td>
</tr>
<tr>
<td>1156980</td>
<td>Fixed an issue with channel hopping on the EFR32xG22 and later where use of RAIL_RX_CHANNEL_HOPPING_OPTION_RSSI_THRESHOLD can prevent the timed RX channel hopping modes including RX duty-cycling from timing out properly.</td>
</tr>
<tr>
<td>1175684</td>
<td>Fixed an issue with the RAIL_IDLE form of RAIL_Idle() and RAIL_STOP_MODE_PENDING form RAIL_StopTx() during the LBT/CSMA phase of a transmit which could previously hang. Pending LBT/CSMA and scheduled transmits are now stopped or idled with RAIL_EVENT_TX_BLOCKED triggered, except for idle mode RAIL_IDLE_FORCE_SHUTDOWN_CLEAR_FLAGS.</td>
</tr>
<tr>
<td>1183040</td>
<td>Updated all PHYs built into RAIL on Series 2 platforms using the latest radio calculator to reduce observed high reference spurs.</td>
</tr>
<tr>
<td>1184982</td>
<td>Fixed an issue with RAIL_StartAverageRssi() that could cause execution to hang in interrupt context just before raising RAIL_EVENT_RSSI_AVERAGE_DONE. This was primarily an issue on the EFR32xG21 platform. Note that it is possible, though unlikely, that RAIL_GetAverageRssi() might still return RAIL_RSSI_INVALID after the average RSSI period has finished.</td>
</tr>
<tr>
<td>1184982</td>
<td>Fixed an issue with RAIL_StartAverageRssi() that caused it to mistakenly idle the radio in the newly-activated protocol if a dynamic protocol switch occurred during the averaging operation of the suspended protocol.</td>
</tr>
<tr>
<td>1188083</td>
<td>Fixed an issue where RAIL_Idle() could hang waiting for the radio to idle when using IEEE 802.15.4 fast RX channel switching.</td>
</tr>
<tr>
<td>1190187</td>
<td>Fixed an issue where idling the radio before a Scheduled Receive window ends could cause a subsequent packet that should be silently filtered and rolled back to instead be received with RAIL_RX_PACKET_READY_CRC_ERROR.</td>
</tr>
<tr>
<td>1201506</td>
<td>Fixed an issue in multiprotocol applications where the wrong sync word would be used if two protocols used the same radio configuration and only one of those protocols set a custom sync word with RAIL_ConfigSyncWords() API.</td>
</tr>
</tbody>
</table>

### 16.4 Known Issues in the Current Release
Issues in bold were added since the previous release.

<table>
<thead>
<tr>
<th>ID #</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>641705</td>
<td>Using direct mode (or IQ) functionality on EFR32xG23 requires a specifically set radio configuration that is not yet supported by the radio configurator. For these requirements, reach out to technical support who could provide that configuration based on your specification</td>
</tr>
</tbody>
</table>

Infinite receive operations where the frame's fixed length is set to 0 are not working correctly on the EFR32xG23 series chips.
<table>
<thead>
<tr>
<th>ID #</th>
<th>Description</th>
<th>Workaround</th>
</tr>
</thead>
<tbody>
<tr>
<td>732659</td>
<td>On EFR32xG23: Wi-SUN FSK mode 1a exhibits a PER floor with frequency offsets around ± 8 to 10 KHz Wi-SUN FSK mode 1b exhibits a PER floor with frequency offsets around ± 18 to 20 KHz</td>
<td></td>
