The BB50 Explorer Kit is an ultra-low cost, small form factor development and evaluation platform for the EFM8BB50 Busy Bee 8-bit microcontroller.

The BB50 Explorer Kit is focused on rapid prototyping and concept creation of multi-purpose applications. It is designed around the EFM8BB50 MCU, which is an ideal device family for developing energy-friendly embedded applications.

The kit features a USB interface, an on-board SEGGER J-Link debugger, one user-LED and button, and support for hardware add-on boards via a mikroBUS™ socket and a Qwiic® connector. The hardware add-on support allows developers to create and prototype applications using a virtually endless combination of off-the-shelf boards from mikroE, sparkfun, AdaFruit, and Seeed Studios.

TARGET DEVICE
- EFM8BB50 Busy Bee 8-bit microcontroller (EFM8BB50F16I-A-QFN16)
- Pipelined 8-bit C8051 core with 50 MHz maximum operating frequency
- 16 kB flash and 512 bytes RAM

KIT FEATURES
- User LED and push button
- 2.54 mm breakout pads
- mikroBUS™ socket
- Qwiic® connector
- SEGGER J-Link on-board debugger
- Virtual COM port
- USB-powered

SOFTWARE SUPPORT
- Simplicity Studio™

ORDERING INFORMATION
- BB50-EK2702A

1. Introduction

The BB50 Explorer Kit has been designed to inspire customers to explore the Silicon Labs EFM8BB50 Busy Bee 8-bit microcontroller. The kit includes a mikroBUS™ socket and Qwiic® connector, allowing users to add features to the kit with a large selection of off-the-shelf boards.

Programming the BB50 Explorer Kit is easily done using a USB Micro-B cable and the on-board J-Link debugger. A USB virtual COM port provides a serial connection to the target application. The BB50 Explorer Kit is supported in Simplicity Studio™ and a Board Support Package (BSP) is provided to give application developers a flying start.

Connecting external hardware to the BB50 Explorer Kit can be done using the breakout pads which present peripherals from the EFM8BB50 Busy Bee such as I^2C, SPI, UART, and GPIOs. The mikroBUS socket allows inserting mikroBUS add-on boards which interface with the EFM8BB50 through SPI, UART, or I^2C. The Qwiic connector can be used to connect hardware from the Qwiic Connect System through I^2C.

1.1 Kit Contents

The following items are included in the box:
- 1x BB50 Explorer Kit board (BRD2702A)

1.2 Getting Started

Detailed instructions for how to get started with your new BB50 Explorer Kit can be found on the Silicon Labs web pages:
silabs.com/dev-tools

1.3 Hardware Content

The following key hardware elements are included on the BB50 Explorer Kit:
- EFM8BB50 Busy Bee MCU with 50 MHz operating frequency, 16 kB flash, and 512 bytes RAM
- One LED and one push button
- On-board SEGGER J-Link debugger for easy programming and debugging, which includes a USB virtual COM port
- MikroBUS™ socket for connecting Click boards™ and other mikroBUS add-on boards
- Qwiic® connector for connecting Qwiic Connect System hardware
- Breakout pads for GPIO access and connection to external hardware
- Reset button
1.4 Kit Hardware Layout

The layout of the BB50 Explorer Kit is shown below.

![BB50 Explorer Kit Hardware Layout](image)

**Figure 1.1. BB50 Explorer Kit Hardware Layout**
2. Specifications

2.1 Recommended Operating Conditions

</table>

1 Not recommended for use with rechargeable Lithium batteries. Most Li-Ion and Li-Po cells exceed 3.6 V when fully charged.
2 When using the provided interfaces with add-on boards or other external hardware, tighter voltage limits might apply.

2.2 Current Consumption

The operating current of the board greatly depends on the application and the amount of external hardware connected. The table below attempts to give some indication of typical current consumptions for the EFM8BB50 and the on-board debugger. Note that the numbers are taken from the data sheets for the devices. For a full overview of the conditions that apply for a specific number from a data sheet, the reader is encouraged to read the specific data sheet.

2 From EFM32GG12 data sheet.
3. Hardware

The core of the BB50 Explorer Kit is the EFM8BB50 Busy Bee 8-bit microcontroller. Refer to section 1.4 Kit Hardware Layout for placement and layout of the hardware components.

3.1 Block Diagram

An overview of the BB50 Explorer Kit is illustrated in the figure below.

![Kit Block Diagram](image)

Figure 3.1. Kit Block Diagram
3.2 Power Supply

The kit is powered by the debug USB cable as illustrated in the figure below.

![Figure 3.2. BB50 Explorer Kit Power Topology](image)

The 5 volt power net on the USB bus is regulated down to 3.3 V using a low dropout regulator (LDO). An automatic isolation circuit isolates the LDO when the USB cable is not plugged in.

Power can be injected externally on the VMCU net if the USB cable is removed and no other power sources are present on the kit. Failure to follow this guideline can cause power conflicts and damage the LDO.

3.3 EFM8BB50 Reset

The EFM8BB50 can be reset by a few different sources:
- A user pressing the RESET button.
- The on-board debugger pulling the #RESET pin low.

3.4 Push Button and LED

The kit has one user push button, marked BTN0, that is connected to a GPIO on the EFM8BB50. The button is connected to pin P0.7 and it is debounced by an RC filter with a time constant of 1 ms. The logic state of the button is high while the button is not being pressed, and low when the button is pressed.

The kit also features one yellow LED, marked LED0, that is controlled by a GPIO pin on the EFM8BB50. The LED is connected to pin P1.2 in an active-high configuration.

![Figure 3.3. Button and LED](image)
3.5 On-board Debugger

The BB50 Explorer Kit contains a microcontroller separate from the EFM8BB50 Busy Bee that provides the user with an on-board J-Link debugger through the USB Micro-B port. This microcontroller is referred to as the "on-board debugger", and is not programmable by the user. When the USB cable is removed, the on-board debugger goes into a very low power shutoff mode (EM4S).

In addition to providing code download and debug features, the on-board debugger also presents a virtual COM port for general purpose application serial data transfer.

The figure below shows the connections between the target EFM8BB50 device and the on-board debugger. The figure also shows the presence of the Mini Simplicity Connector, and how this is connected to the same I/O pins.

Refer to chapter 4. Debugging for more details on debugging.

3.6 Connectors

The BB50 Explorer Kit features a USB Micro-B connector, breakout pads, a mikroBUS connector for connecting mikroBUS add-on boards, and a Qwic connector for connecting Qwic Connect System hardware. The connectors are placed on the top side of the board, and their placement and pinout are shown in the figure below. For additional information on the connectors, see the following sub chapters.

---

**Figure 3.4. On-Board Debugger Connections**

**Figure 3.5. BB50 Explorer Kit Connectors**
3.6.1 Breakout Pads

Seventeen breakout pads are provided and allow connection of external peripherals. The breakout pads are arranged in two rows and contain a number of I/O pins that can be used with most of the EFM8BB50 Busy Bee’s features. Additionally, the VMCU (main board power rail), 3V3 (LDO regulator output), and 5V power rails are also exposed on the pads.

The pin-routing on the Busy Bee is flexible, so most peripherals can be routed to any pin on port 1 or 2. However, pins may be shared between the breakout pads and other functions on the BB50 Explorer Kit. The figure in section 3.6 Connectors includes an overview of the breakout pads and functionality that is shared with the kit.

3.6.2 MikroBUS Socket

The BB50 Explorer Kit features a mikroBUS™ socket compatible with mikroBUS add-on boards. MikroBUS add-on boards can expand the functionality of the kit with peripherals such as sensors and LCDs. Add-on boards follow the mikroBUS socket pin mapping, and communicate with the on-kit EFM8BB50 through UART, SPI, or I2C. Several GPIOs are exposed on the mikroBUS socket. MikroBUS add-on boards can be powered by the 5V or VMCU power rails, which are available on the mikroBUS socket.

The pinout of the EFM8BB50 on the kit is made such that all required peripherals are available on the mikroBUS socket. The I2C signals are, however, shared with the Qwiic connector, and all mikroBUS signals are also routed to adjacent breakout pads.

When inserting a mikroBUS add-on board, refer to the orientation notch on the BB50 Explorer Kit, shown in the figure below, to ensure correct orientation. Add-on boards have a similar notch that needs to be lined up with the one shown below.

![mikroBUS socket and orientation notch](image)

Figure 3.6. mikroBUS Add-on Board Orientation

The table below gives an overview of the mikroBUS socket pin connections to the EFM8BB50.

### 3.6.3 Qwiic Connector

The BB50 Explorer Kit features a Qwiic® connector compatible with Qwiic Connect System hardware. The Qwiic connector provides an easy way to expand the functionality of the BB50 Explorer Kit with sensors, LCDs, and other peripherals over the I₂C interface. The Qwiic connector is a 4-pin polarized JST connector, which ensures the cable is inserted the right way.

Qwiic Connect System hardware is daisy chain-able as long as each I₂C device in the chain has a unique I₂C address.

**Note:** The Qwiic I₂C connections on the BB50 Explorer Kit are shared with the mikroBUS I₂C signals.

The Qwiic connector and its connections to Qwiic cables and the EFM8BB50 are illustrated in the figure below.

![Qwiic Connector Diagram](image)

**Figure 3.7. Qwiic Connector**

The table below gives an overview of the Qwiic connections to the EFM8BB50.

### 3.6.4 Debug USB Micro-B Connector

The debug USB port can be used for uploading code, debugging, and as a virtual COM port. More information is available in section 4. Debugging.
4. Debugging

The BB50 Explorer Kit contains an on-board SEGGER J-Link Debugger that is connected to the C2 debugging interface on the EFM8BB50. The debugger allows the user to download code and debug applications running in the target EFM8BB50. Additionally, it also provides a virtual COM port (VCOM) to the host computer that is connected to the target device's serial port for general purpose communication between the running application and the host computer. The on-board debugger is accessible through the USB Micro-B connector.

4.1 On-board Debugger

The on-board debugger is a SEGGER J-Link debugger running on an EFM32 Giant Gecko. The debugger is directly connected to the debug and VCOM pins of the target EFM8BB50.

When the debug USB cable is inserted, the on-board debugger is automatically active, and takes control of the debug and VCOM interfaces. This means that debug and communication will not work with an external debugger connected at the same time. The on-board LDO is also activated, providing power to the board.

When the USB cable is removed, the board might still be running on external power, as described in section 3.2 Power Supply. In this case, the on-board debugger goes into a very low power shutoff mode (EM4S), consuming about 80 nA.

4.2 Virtual COM Port

The virtual COM port is a connection to a UART of the target EFM8BB50 and allows serial data to be sent and received from the device. The on-board debugger presents the target UART as a virtual COM port on the host computer that shows up when the USB cable is inserted.

Data is transferred between the host computer and the debugger through the USB connection, which emulates a serial port using the USB Communication Device Class (CDC). From the debugger, the data is passed on to the target device through a physical UART connection.

The serial format is 115200 bps, 8 bits, no parity, and 1 stop bit by default.

**Note:** Changing the baud rate for the COM port on the PC side does not influence the UART baud rate between the debugger and the target device.
5. Schematics, Assembly Drawings, and BOM

Schematics, assembly drawings, and bill of materials (BOM) are available through Simplicity Studio when the kit documentation package has been installed. They are also available from the kit page on the Silicon Labs website: silabs.com.
6. Kit Revision History and Errata

6.1 Revision History

The kit revision can be found printed on the box label of the kit, as outlined in the figure below. The kit revision history is summarized in the table below.
